#### ABSTRACT

This document, 10th in a series of 11 subvolumes of a handbook providing training for educational research and development personnel in the development of instructional materials, deals with the task of evaluating instructional materials. The document is organized according to the three sequential steps involved in performing the task. Step 1 is to conduct an information tryour of the instructional program and revise the program when necessary. Step 2 is to conduct a developmental tryout of the instructional program and revise the program when necessary. Step 3 is to conduct a field test of the instructional program. More specific substeps list the procedures for performing the steps. Background information covers (a) purposes of evaluation; (b) the cyclical nature of program tryout and revision; (c) four interrelated elements in the tryout and revision process; and (d) the amount of program material to schedule for tryout. (PD)

- PLAN STUDY OF CRITERION BEHAVIORS
- COLLECT, AND ANALYZE DATA ABOUT CRITERION BEHAVIORS 8
- SEQUENCE AND GROUP CRITERION BEHAVIORS
- STATE CRITERION AND PREPARATORY OBJECTIVES D.
- PLAN SIK ULATION BASED ON INSTRUCTIONAL AND LOGISTICAL NEEDS E.
- **DEVELOP DIAGNOSTIC AND EVALUATIVE TESTS**
- FORMULATE INSTRUCTIONAL STRATEGIES G.
- PLAN ACCOMMODATION OF INDIVIDUAL DIFFERENCES
- DEVELOP INSTRUCTIONAL MATERIALS
- **EVALUATE INSTRUCTIONAL MATERIALS**

#### **VOLUMES IN THIS SERIES**

- 1. USER'S MANUAL
- 2. ORIENTATION
- 3. HANDBOOK (eleven sub-volumes)
- 4. WORKBOOK
- 5. FINAL EXERCISES

#### **FORFWORD**

This is one of a series of eleven HANDBOOK sub-volumes which has been prepared to provide training for educational R&D personnel in the development of instructional materials.

The USER'S MANUAL, which accompanies the series, describes the role each volume is designed to play and the sequence recommended for its use in the training process. The user is, therefore, urged to read the instructions in the USER'S MANUAL before using this or any other separate volume.

#### **ACKNOWLEDGMENTS**

The materials in this volume were prepared under a contract from the U.S. Office of Education, Contract No. OEC-0-70-4776(520). Dr. George L. Gropper, Director of Instructional Media Studies, served as principal investigator.

U.S.O.E. sponsorship does not in any way imply official endorsement of the views expressed in this volume.

The author is indebted: to Dr. Robert Fitzpatrick for reviewing portions of the series of volumes and for informal discussions concerning several training issues; to Mrs. Zita Glasgow for the first and critical use of this volume; and, not least, to Miss Kathleen Gubala for her tireless preparation of the complex manuscript required by this HANDBOOK.

George L. Gropper March 1973

#### BACKGROUND INFORMATION: FOR ENTIRE "J"

	page
Purposes of evaluation: Student evaluation	2
Sources of evaluation information	3
What the <u>three</u> STEPS in TASK "J" accomplish	4
Cyclical nature of program tryout and revision	5
Four interrelated elements in the tryout and revision process	6
How much program material to schedule for tryout	7 .

#### TWO MAJOR PURPOSES IN USING EVALUATION PROCEDURES

		<u></u>
PURPOSES	Assessing the ADEQUACY OF THE INSTRUCTIONAL PROGRAM	Assessing the LEVEL OF STUDENT PROFICIENCY
	-An assessment performed only on a limited number of occasions: • During the preparation of the instructional program	-An assessment performed on a routine basis every time the instructional program is given
	<ul> <li>Immediately after the program has been completed</li> </ul>	·
CRITERIA	-Assessment is discontinued when student performance based on the program reaches a pre-determined standard	
	-Assessment is used to identify weaknesses (allowing those portions of the program which result in errors to be revised)	-Assessment is used to identify levels of student proficiency as a basis for decisions:  ••To allow students to go on to
		new portions of a program
		OR
		••To require them to take remedial instructional sequences
	-Assessment is based on:	-Assessment is based on:
	••Student performance on the instructional program	••Student performance on criterion and sub-criterion tests
	<ul> <li>Student performance on criterion and sub-criterion tests</li> </ul>	
	<ul> <li>Student performance on diagnostic tests</li> </ul>	
	<ul> <li>Student responses to diagnostic prohes during interviews (during program development)</li> </ul>	
	Maria diarente de la companya de la	

Only evaluation for purposes of "assessing the adequacy of instructional programs" is treated in this volume devoted to TASK "J."

## THREE SOURCES OF INFORMATION USED AS A BASIS FOR IDENTIFYING PROGRAM WEAKNESSES AND FOR REVISING THE PROGRAM

SOURCES OF INFORMATION	Student performance on PROGRAM PROBLEMS	Student responses to INTERVIEW PROBES about performance on the program	Student performance on TESTS
CRITERIA	-Student performance on program problems or tasks is used to identify errors occurring on specific:  • Program problems  • Program procedures or tasks  -To the extent that a problem or task is restricted to one particular component skill, performance on that problem can be diagnostic of a failure to acquire that skill	-When a problem solution is dependent on more than one skill, (and an error is therefore not diagnostic of a particular learning failure), the use of interview probes can lead to the identification of:  • The nature of the error made  • The possible source of the error	-Student performance on tests (whether criterion, sub-criterion, or diagnostic) is used to identify the adequacy of instructional responses to teach:  ••Criterion behaviors ••Sub-criterion behaviors

TO BE COVERED IN:	Sub-STEP J.1.1	Sub-STEP J.1.1	Sub-STEP J.1.2

J.
IDENTIFICATION
. MATRIX

#### WHAT IS PERFORMED IN THE THREE "STEPS" OF TASK "J"

STEPS	J.1 INFORMAL TRYOUT	J.2 DEVELOPMENTAL TRYOUT*	. J.3 FIELD TESTING**
CRITERIA	-The informal tryout of the program with a small sample of students from the target population -The revision of the program based on student performance on program problems and tasks	-The administration of the program to a representative sample of the target population:  • The identification of program problems which result in a relatively high percentage of errors  -The administration of tests to determine the level of proficiency achieved by students for the criterion and sub-criterion behaviors	the program to a large sample of the target population as a means of:  • Providing specifications of the program's capability of producing a pre-determined layer of
		-The revision of the program based on sequences identified as not having produced an adequate proficiency level	
TO BE COVERED IN: ON PAGE:	STEP J.1	STEP J.2 89	STEP J.3 221

\*\*often referred to as "formative evaluation"
\*\*often referred to as "summative evaluation"

J.

#### THE CYCLICAL NATURE OF THE TRYOUT AND REVISION PROCESS

#### MATRIX

STEPS	J.1 INFORMAL TRYOUT	J.2 DEVELOPMENTAL TRYOUT	J.3 FIELD TESTING
CRITERIA	-Informal developmental tryout is performed cyclically:  •One or two students take the program, and program problems on which they make errors are revised  •An additional one or two students take the revised program; the errors they make on the program become the basis for a further revision  -Additional informal tryout cycles may be used depending on time/money considerations and on how well the program is working	-A tryout of the program with a representative sample of the target population is performed cyclically:  • Approximately 25-50 students take the program and associated tests; revisions in the program are made based on program errors and test scores  • An additional sample takes the revised program; program errors and test errors are noted; if the predetermined standards are still not met, an additional revision is made, and the revised version is again tried out  - The tryout and revision cycle ends only when a predetermined standard is met	-The final evaluation of the program is not used as a basis for revision  -The final evaluation with a large sample of the target population (a sample of approximately 200-500) is conducted to provide specifications for the program (if it is to be given wide distribution)  -Only test results (not program problem results) are likely to be reported

# FOUR INTERRELATED ELEMENTS IN THE TRYOUT AND REVISION PROCESS

# IDENTIFICATION MATRIX

ELEMENTS	). STUDENT PERFORMANCE	2. DIAGNOSIS OF LEARNIMG AND PERFORMANCE FAILURE	3. DIAGNOSIS OF PROGRAM WEAKNESS	4. Program Revision
GRITERIA	-Students' performance provides a basis for diagnosing what students have failed to learn -Results used to make diagnoses include:  • Errors on program problems or tasks • Errors on tests	-Student failures provide a basis for diagnosing ueaknesses in the instructional program -learning failures indicative of program weaknesses include failure to acquire:  • Discriminations  • Generalizations  • Ceneralizations  • Chains  • Chains	-Identified program  weaknesses provide a basis for revising the program  -Types of program weaknesses likely to be revealed: Amount" of ariterion behavior selected to be practiced at the same time is too large The degree of assistance provided is too low An insufficient amount of practice has been provided inadequately implemented Faulty "behavior control" Faulty sequencing	-Based on identified program weaknesses, the following types of changes are made:"Amount" of criterion behavior practiced at the same time is reducedAssistance is strengthenedAdditional practice is provided"Progressions" are improvedProcedures for "behavior control" are improvedFocedures is alteredSequence is altered

J. DECISION MATRIX

#### HOW MUCH PROGRAM MATERIAL TO SCHEDULE FOR TRYOUT\*

CONDITIONS	MORE THAN ONE criterion behavior covered in an instructional hour	ONE criterion behavior covered in an instructional hour	It requires TWO OR MORE INSTRUCTIONAL HOURS to cover a criterion behavior
ACTION TO TAKE	-Schedule the tryout of all the instructional material it requires to administer (approximately one hour)		-Schedule (in one sitting) the tryout of all the instructional material associated with sub-criterion behaviors covered in:
·			••One instructional hour OR ••Two or three instructional hours (at a maximum)
			-Schedule as many separate tryout periods as required to cover the criterion behavior

<sup>\*</sup>The subsequent discussion is concerned with the tryout of instructional materials covering a single criterion behavior and its associated sub-criterion behaviors.

STEP

J.1

J.1

Conduct an informal tryout of the instructional program and revise the program when necessary  $\overset{\bullet}{\star}$ 

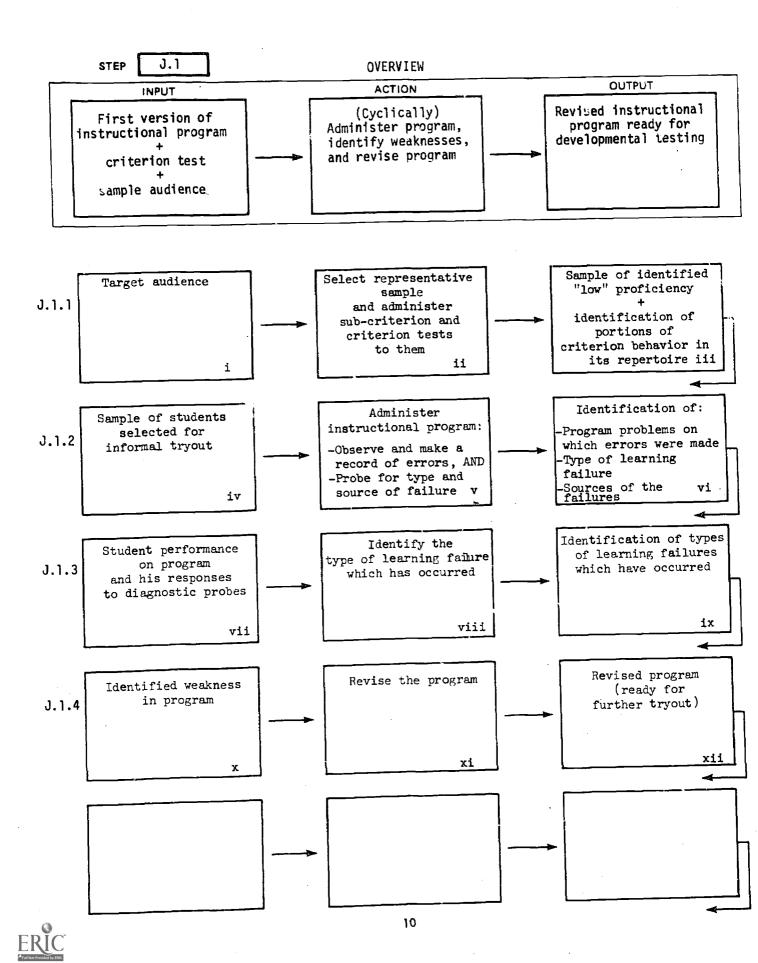

J.1.1 Administer criterion test (and sub-criterion test) as a "before" test to a small sample of the target population.

J.1.2 Administer the program to one student at a time, and, when errors are committed, probe for the source of the problem.

J.1.3 Interpret the nature of the learning failure.

J.1.4 Make revisions in the instructional program based on identified program weaknesses.

\*The cycle of Sub-STEPS J.1.1, J.1.2, J.1.3, and J.1.4 should be repeated as many times as is feasible within schedule and budgetary constraints. Reduced frequency of student errors indicates that there is no need for further recycling of informal tryout and revision.

COMPLETED MATERIALS STEP		COMPLETED FORMS STEP		BLANK FORMS
Identification of audience characteristics	A.1.2	Sub-criter on and criterion tests: FORM F.2(1)		
Identification of audience characteristics (based on tests)	F.4.2	(carried forward from)	I.2	
		·		

#### BACKGROUND INFORMATION

<u>.</u>	page
Information obtained from tests administered "before" and "after" students receive instruction	16
Properties of an adequate sample of the target audience for purposes of the informal program tryout	17
	·

DIFFERENT TYPES OF INFORMATION OBTAINED BY TESTS
ADMINISTERED "BEFORE" AND "AFTER" THE INSTRUCTIONAL PROGRAM

TIME OF TEST ADMINISTRATION	Test administered BEFORE instructional progr <b>a</b> m	Test administered AFTER instructional program*
CRITERIA	-Test results can be used to identify what students can do before they have taken the instructional program:  ••Whether they can exhibit the total	-Test results can be used to identify what students can do after they have taken the instructional program:
	<ul> <li>Whether they can exhibit one or which make up the criterion behavior</li> <li>Whether they can exhibit one or</li> </ul>	more sub-criterion behaviors avior

#### RATIONALE FOR USE

- -Permits the developer to differentiate between satisfactory performance on program problems and tasks which is due:
- ••To students' entering
  proficiency; OR
- •• To the capacity of the program to instruct
- -If the student can perform before beginning instruction, his performance on the program reveals nothing about the program's adequacy
- -Results on "after" test, when compared with those on "before" test, can be used to identify how well the program builds proficiency at:
- ·· Criterion behavior
- · · Sub-criterion behaviors

<sup>\*</sup>Tests administered after <u>informal</u> tryout produce equivocal results. This is so because of the interview procedures used during the program tryout and the effects that questions may have on what is learned. For this reason, it is probably better not to administer the tests after instruction (or if they are used, to interpret their results with caution). "After" tests are used during the developmental tryouts (See STEP J.2).

## PROPERTIES OF AN ADEQUATELY SELECTED SAMPLE OF TARGET AUDIENCE FOR ADMINISTRATION OF PROGRAM (PRIOR TO REVISION)

PROPERTIES OF SAMPLE	SIZE	REPRESENTATIVENESS	NON-PROFICIENCY at criterion behavior
CRITERIA	-Each tryout (before revision) should be based on a sample of:  • A minimum of two students AND • A maximum of approximately five students	-The sample of students selected for informal tryouts should reflect the target audience for:  • General ability  • Relevant, special abilities  • Estimated levels of entry proficiency (at criterion behavior)	students selected for

RATIONALE	-A sample size of from two to five is:  ••Of sufficient size to reveal program weaknesses  ••Not so large that the interview/ probing procedures used are too time-consuming and costly	-Adequate accommodations of the target audience (i.e., producing a program on which most students can take in relatively error-free fashion) depends on the sample representing:  ••The entry behaviors likely to influence performance  ••The likely performance of the target audience on the program	-If tryout is performed with students who already are highly proficient the tryout will not be capable of assessing the adequacy of the program for bringing up to proficiency those students who are not proficient to begin with

#### JOB PROCEDURES

	_
	page
SUMMARY OF PROCEDURES	20
Adequacy of procedures for selecting sample of target audience and for use of pre-instruction test results	21

#### J.1.1 STANDARDS MATRIX

# ADEQUACY OF SAMPLE SELECTION (AND USE OF PRE-INSTRUCTION TEST RESULTS)

PROPERTIES	REPRESENTATIVENESS	SIZE	DEGREE OF PROFICIENCY
CRITERIA	-Sample selected is representative of (i.e., measures at approximately the mean of distributions) the target population in:  ••General ability ••Specific abilities	-Sample for each tryout and revision eycle ranges from:  ••Two students to  ••Approximately four or six	-Sample has relatively low proficiency in criterion behavior
	(relevant to mastery of the criterion behavior)  ••Pre-instructional proficiency in the criterion behavior		
		•	

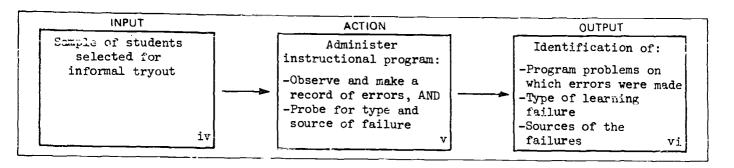

## PREVIEW OF THE NEXT SubSTEP

YOUR PRODUCT	You will have identified: The program problems on which errors have been made. The type(s) of learning failure identified by these errors. The reasons or sources of those failures.
WHAT YOU WILL WORK FROM	(1) Sample of two to five students (2) The program to be taken by them
WHAT YOU WILL	(1) Administer the program to one student at a time (2) Make a record of errors which occur (3) Probe for the type of error and its cause
FORMS YOU WILL USE	FORM J.2(1) (Optional) for recording errors on the program.

DESCRIPTION OF Sub-STEP J.1.2

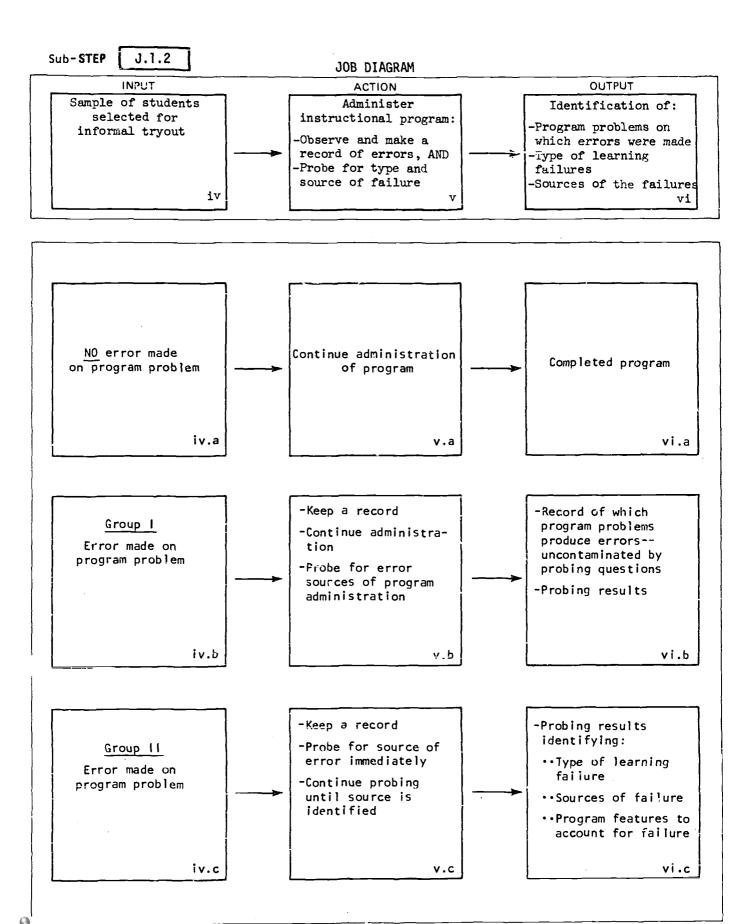

Job Aid Contents

#### BACKGROUND INFORMATION

<del></del>	
•	page
Nature of informal tryout varies depending on type of <u>media</u> used in administering an instructional program	26
Determining how to conduct an informal tryout for programs involving different types of media	27
REVIEW SUB~STEP F.3.2 FOR TREATMENT OF ''PROBES'' USED FOR DIAGNOSING SOURCES OF ERRORS MADE ON CRITERION TESTS	VOLUME F 96-117
FORM J.2(1), SUMMARY OF ERRORS ON CRITERION TEST, also available on an optional basis for summarizing errors on programs	28, 29
Two sources of information used in informal tryouts: observation and probing	30
What you wish to find out by "observation"	31
What you wish to find out by "interview probes"	32
Procedures for "probing"	33

#### MEDIA CALLING FOR DIFFERENT TRYOUT APPROACHES

TYPES OF MEDIA	Media it is likely to be economically or logistically FEASIBLE to use during informal tryout	Media it is likely to be economically or logistically UNFEASIBLE to use during informal tryout
CRITERIA	-PRINT media  • Programs requiring paper-and- pencil responding  -ENVIRONMENTAL media  • Objects or equipment already available and for which the risk or cost of damage is slight  • Already built simulators  -DEVICE media  • Those media which prove not costly but only because the extent of their use is low for the instructional program at hand:  /Slides /Audio tape	-ENVIRONMENTAL media  ··Objects or equipment not yet on hand and either costly to acquire or involving high damage risks  ··People to whom or for whom there is a risk factor  -DEVICE media  ··Those media for which production costs are high:  /Film, animation /TV  ··Those media whose use will be costly because of the extensive use required by the instructional program at hand:
		/Slides /Audio tape

#### J.1.2 DECISION MATRIX

# DETERMINING HOW TO CONDUCT INFORMAL TRYOUT FOR PROGRAMS INVOLVING DIFFERENT TYPES OF MEDIA

	Y	
CONDITIONS	Economically and logistically FEASIBLE to use medium required by the instructional program	Economically and logistically UNFEASIBLE to use medium required by the instructional program
ACTION TO TAKE	-Use the actual media which are called for by the instructional program in the <u>informal</u> tryout	-Conduct informal tryouts with storyboard versions of instructional program:  • Paper-and-pencil scripts replace dialogue (to appear later on film, TV, or tape)  • Drawings or live demonstrations to replace visual events  • Mock-ups to replace actual objects  • Actors to replace the people who are usually found in the criterion situation  - Conduct developmental tryouts (See STEP J.2) with actual media

- -FORM J.2(1) was designed to serve in summarizing errors on criterion tests (See STEP J.2).
- -It is also available, on an <u>optional</u> basis, to serve in summarizing errors which students make on the program during its informal tryout or during its developmental tryout.

#### HOW TO USE THE FORM

(See opposite page for an example of a filled out FORM)

- -A column is used to record tallies for the number of students making errors on each numbered problem or task.
- -Each row (labeled a-e) may be used to record the following types of information:
  - •• For multiple choice type problems, which <u>incorrect</u> options were chosen.
  - ••For problems where more than one response is required, which of the responses is incorrect
- -Two rows (with black border) are available for summarizing the total number of people making errors on a program problem and that number expressed as a percentage of the total number of people taking the program.
- -The bottom section of the FORM can be used to characterize the nature of the performance required on the problem; i.e., RECALL, because it is a problem that repeats an INPUT or OUTPUT, or TRANSFER, because the problem involves new INPUTS or ACTIONS..
- -Sub-criterion problems or criterion problems can be identified by putting one or more asterisks next to the number corresponding to them.

# TWO SOURCES OF INFORMATION ABOUT PROGRAM ADEQUACY WHICH ARE USED IN INFORMAL TRYOUTS

SOURCES OF INFORMATION	OBSERVATION	INTERVIEW PROBES
CRITERIA	-As an individual student works on each program problem or task (presented by print, environmental, or device media), the developer observes student performance in order:  ••To determine whether the student has made an error on that problem;  AND  ••To summarize the error results for the whole succession of program problems leading up to the criterion problem(s)	-When it is determined from observation that a student has made an error on a particular problem, he is asked probing questions in order:  ••To identify the source of or the reason for student failure to get a correct answer

#### TYPES OF INFORMATION YOU WISH TO OBTAIN FROM "OBSERVATION"

INFORMATION SOUGHT	On WHICH problems are errors being made?	WHAT TYPE of errors are being made?	HOW MANY people are making HOW MANY errors?
CRITERIA	-On which (numbered) problems are errors made?  -On multiple choice problems, which incorrect options are endo:sed?*  -On a problem with more than one part to it, on which parts are errors made?  -Is there a succession of problems on all of which errors are made?  -Where in a succession of problems is an isolated error made?	-Are errors made on:  ··Criterion problems  ··Sub-criterion problems OR  ··"Progression" problems -Are errors being made on problems that involve:  ··RECALL AND/OR  ··TRANSFER  -Are errors being made on problems that involve only one component skill (and whose results are therefore diagnostic of a specific problem)?  -Is an error one of omission (i.e., no answer given) or of commission (i.e., wrong answer given)?	-How many people (what percentage of all those doing a problem) make errors on a problem?  -On multiple choice problems, how many people endorse which wrong options?  -On multiple part problems, how many people make errors on particular parts?  -On how many problems in a series leading up to a criterion or sul-criterion are there errors?

\*Whenever a particular option is associated with a particular type of error (e.g., association or discrimination), these results can be diagnostic.

#### TYPES OF INFORMATION YOU WISH TO OBTAIN FROM "PROBES"

INFORMATION SOUGHT	WHICH COMPONENT SKILL does the failure induce?	WHICH PROPERTIES of INPUTS, ACTIONS, OUTPUTS account for the failure?	DOES PROBLEM FORMAT account for the failure?
CRITERIA	-Which component skills does the failure involve:  Discriminations Generalizations Associations OR Chains -Does the failure consist of: The skill being incorrectly learned OR The skill not having been learned at all	-Which properties of INPUTS, ACTIONS, or OUTPUTS:  • Do students overlook or not pay attention to  OR  • Do students confuse  -Are there properties of the examples of INPUTS, ACTIONS, or OUTPUTS which are used which result in:  • Student confusion	

### THE "PROBING" PROCESS

	page
When probes are needed	34
Priorities in the types of probes used	35
Some general probes to use to identify problems	36
Follow-up probes to use in response to student answers to initial probes	37, 38
General vs. specific types of probes	39
Responses to general probes which do not unambiguously identify the type of learning failure	40
Specific probes which can be used to identify the type of learning failure	41
Why probes are not needed concern- ing "chaining" failures	42
Timing of probes	43

### DETERMINING WHEN PROBES ARE NEEDED

CONDITIONS	An error is made on a problem or task AND The problem or task involves MORE THAN ONE component skill	An error is made on a problem or task AND The problem or task involves ONLY ONE component skill
ACTION TO TAKE	-Probe in order to find out <u>which</u> component skill may not have been learned*	-Do not probe; failure on the problem identifies which component skill:  ••Has not been learned  OR  ••Has been learned incorrectly
	*The same wrong response may be indicative of a failure to learn a discrimination, generalization, or association	

EXAMPLE	Example of a <u>non</u> -diagnostic problem "Which is correct?" The man walk to workThe man walks to work.	Example of a diagnostic problem  "Both sentences below use a subject which is singular. Which has the correct verb?" The man walk to work. The man walks to work.
	An error could be due either to a failure to discriminate between singulars or plurals; or to a failure to associate the proper form of the verb with singular and plural forms.	An error is likely to be due to a failure to associate the proper form of the verb with a singular subject. (This assumes that the student has already learned what a singular subject is.)

### DETERMINING PRIORITIES IN THE ORDER IN WHICH DIFFERENT TYPES OF PROBING QUESTIONS SHOULD BE ASKED

PRIORITIES	FIRST	If <u>first</u> answers provide Indeterminate results SECOND	If <u>second</u> answers still provide indeterminate results THIRD
ACTION TO TAKE	-Ask open-ended questions which do not identify or suggest answers student might give		-Ask directed questions
	-Do <u>not</u> call attention either to the INPUTS or to the ACTIONS for him to focus on	generally either to	-Call attention to INPUTS or to ACTIONS
	-Do <u>not</u> call attention to specific properties of INPUTS or of ACTIONS to focus on	-Do <u>not</u> call attention to specific properties of INPUTS or of ACTIONS to focus on	-Call attention to specific properties for student to focus on
	-Do not direct attention to any features of problem format	-Do <u>not</u> call attention to specific properties of the problem format	

EXAMPLES	-"Why did you ?" take this ACTION	-"What is there about this that made INPUT you 7" take this ACTION	-"Which of these of the properties made you INPUTS ?"
	e.g., "Why did you classify the <u>Leaf</u> this way?"	e.g., "What property or attribute of this <u>leaf</u> made you <u>classify</u> it this way?	e.g., "Which of these leaf properties: <u>size</u> , shape, or <u>color</u> made you  make this  particular  classification?"
	-"Is there anything about the way the problem is presented which led you to give your answer?"	-"Did you have trouble with:  • The vocabulary  • The instructions  • The meaning of sentences  • The use of the diagrams  • Etc.	-"Did you have trouble with:  • This word • This diagram • This illustration • The significance of this arrow • Etc.

### DETERMINING WHAT GENERAL PROBES TO USE (ON PROGRAM PROBLEMS WHICH ARE NON-DIAGNOSTIC)

CONDITIONS	-NO answer is given -NO procedure or ACTION is taken on program problem	-A <u>WRONG</u> answer is given -A <u>WRONG</u> procedure or ACTION is taken on program problem
ACTION TO TAKE (by priorities)	#1: OPEN-ENDED PROBE  • What's giving you trouble on this problem?  • What did you leave out the answer (fail to do something)?  #2: LESS OPEN-ENDED PROBE  • Are there any answers you thought of but ruled out? (If so, why?)  • Are there any changes that could be made in the problem that would have enabled you to solve it?  #3: MORE DIRECT PROBE  • If I call your attention to this of the or INPUT ACTION can you give the answer now?  • Here are some possible answers; which is the right one?	#1: OPEN-ENDED PROBE  What made you give the answer you did?  What is there about the problem that led you to give that conswer?  #2: LESS OPEN-ENDED PROBE  Are there any other answers you thought of but ruled out? (If so, why?)  What changes in the problem would lead you to give another answer?  #3: MORE DIRECT PROBE  If I call your attention to this of the or property INPUT ACTION would you still give the same answer?  Which of these properties,  or did you consider relevant (irrelevant)?

## DETERMINING WHAT KINDS OF FOLLOW-UP PROBES TO USE IN RESPONSE TO STUDENT ANSWERS TO INITIAL PROBES (ERROR ON PROGRAM: NO ANSWER)

CONDITIONS	-Type of error on program:  ••No answer  + -Response to earlier, more open-ended probe: ••"I DON'T KNOW"	-Type of error on program:  ••No answer  + -Response to initial probes:  ••Cites possible answers or properties of INPUTS or ACTIONS about which he is UNCERTAIN	-Type of error on program:  ••No answer  + -Response to initial probes:  ••Cites irrelevant or incorrect properties of INPUTS or ACTIONS ••Cites incorrect answers
ACTION TO TAKE	-Use less open-ended probes  -Continue using increasingly more direct probes until student identifies the source of the difficulty:  • Features of the problem content OR  • Features of the problem format	-Probe for which answer he thinks correct (and why) -Probe for reason for his uncertainty -Probe for student's idea of the relationship between properties he identifies and possible answers	-Probe for why he cited these properties and how they relate to the answer -Probe for why he gave the answers he did -Probe for alternative answers he considered and why he rejected them

EXAMPLES	SEE PAGE 36	-"Which of the answers you mentioned do you think is correct? Why?" -"What is it that makes you uncertain?" -"What else do you feel you need to know in order to decide?"	-"Why did you say incorrect answer"Why did you say incorrect/irrelevant ?" property -"Did you consider any other answers/ ?" properties
----------	-------------	---	---

## DETERMINING WHAT KINDS OF FOLLOW-UP PROBES TO USE IN RESPONSE TO STUDENT ANSWERS TO INITIAL PROBES (ERROR ON PROGRAM: INCORRECT ANSWER)

CONDITIONS	-Type of error on program: Incorrect answer + -Responses to earlier, more open-ended probe:"  DON'T KNOW"	-Type of error on program:  ••Incorrect answer  + -Responses to initial probes: ••Cites irrelevant or incorrect properties
ACTION TO TAKE	-Use less open-ended probes  -Continue using increasingly more direct probes until student identifies the source of the difficulty:  ••Features of the problem content OR  ••Features of the problem format	-Probe for why he cited these properties and how they relate to the answer -Probe for why he gave the answers he did -Probe for alternative answers he considered and why he rejected them

EXAMPLES	SEE PAGE 36	-"Why did you say incorrect answer"  -"Why did you say incorrect/irrelevant property
		-"Did you consider any other ?" answers/properties

### PURPOSE OF TWO TYPES OF PROBES: GENERAL VS. SPECIFIC

TYPES	GENERAL	SPECIFIC
OF PROBES	PROBES	PROBES
CRITERIA	that occ.rred (1 tions, generalis	identify the f learning failure i.e., discrimina- vations, r chains) and the

EXAMPLES	SEE PAGES 36-38	SEE PAGES · 40-41
	•	

# SITUATIONS FOLLOWING RESPONSES TO GENERAL PROBES IN WHICH IT IS UNCLEAR WHICH COMPONENT SKILL(S) HAS OR HAS NOT BEEN IDENTIFIED AS THE ONE NOT LEARNED

SITUATIONS	Uncertainty whether	Uncertainty whether	Uncertainty whether
FOLLOWING	there has been a	there has been a	there has been a
USE OF	failure to learn	failure to learn	failure to learn
GENERAL PROBES	DISCRIM!NATIONS	GENERALIZATIONS	ASSOCIATIONS
CRITERIA	Responses to general probes have failed to indicate:  -Whether a student can or cannot tell the difference between INPUTS belonging to different classes because he does none of the following; he does NOT:  • Identify (correctly or incorrectly) the class to which the example used in the problem belongs  • Attribute class properties (correctly or incorrectly) to the example	Responses to general probes have failed to indicate:  -Whether a student can or cannot see the similarity among INPUTS belonging to the same classes because he does none of the following; he does NOT:  ··Identify (correctly or incorrectly) the class to which the example used in the problem belongs  ··Attribute class properties (correctly or incorrectly) to the example	Responses to general probes have failed to indicate:  -Whether a student can or cannot tell which ACTION goes with which INPUT because he does none of the following; he does NOT:  ••Identify all possible ACTIONS that could be taken (depending on which class of INPUTS is involved)  ••Identify all possible INPUTS which would require different actions  ••Mismatch INPUTS and ACTIONS

	e.g.,	e.g.,
EXAMPLES	-The student has on a program problem incorrectly labeled a lever as a 2nd class lever	-The student doesn't identify properties of the three classes
	-In response to probes he does not say why he labeled it that way; he doesn't say, for example, because the effort force is between the resistance force and the fulcrum	of levers and then indicate that he doesn't know which is called 1st. 2nd, or 3rd class
		January Causa

## DETERMINING HOW TO PROBE SPECIFICALLY FOR SPECIFIC TYPES OF LEARNING FAILURES WHEN GENERAL PROBES HAVE NOT IDENTIFIED THEM

CONDITIONS	Uncertainty whether there is a DISCRIMINATION failure	Uncertainty whether there is a GENERALIZATION failure	Uncertainty whether there is an ASSOCIATION failure
ACTION TO TAKE	-Present additional examples from a different INPUT class which is represented in the original program problem and ask:  • Are these the same or different?  OR  • Should these be handled or treated the same way or in different ways?	-Present additional examples from the same INPUT class which is represented in the original program problem and ask:  ·Are these the same or different? OR ·Should these be handled or treated the same way or in different ways?	-If behavior has been taught in two directions:  INPUT → ACTION and ACTION → INPUT:  • Reverse a test question and determine whether same mismatch occurs
	-If examples vary dimensionally, present pairs of INPUT examples (using the original example as one member) which start far apart and gradually are made more similar . Determine when and where discrimination breaks down	pairs of INPUT examples (using the original example as one member) which start close together and gradually are made more dissimilar • Determine when and	classes of inputs and all the actions that can be taken and then ask:  ••Which goes  ACTION  with which ?  INPUT

	e.g.,	e.g.,
EXAMPLES	"Here's another lever (from same or different class); is this like the one in the problem or different from it?"  "What do they have in common?"  OR  "In what way are they different?"	"Here are examples of all three classes of levers. Which of the belongs to the 1st, to the 2nd, and to the 3rd class?"
	l	

### DIFFERENCES IN NEED TO PROBE FOR COMPONENT SKILLS

PROBING NEEDS	There IS a need to probe for failure in: -Discriminations -Generalizations -Associations	There is NO need to probe for failure in: -Chaining
CRITERIA	-A wrong answer for a single Sub-STEP (involving just one association) can be due to one or more of the above types of failure  -Therefore, probing is designed to find out which of the types of failures occurred	-Proving is used to find out the type of failure involved within each of the separate Sub-STEPS in a chain  -When the problem task involves producing a series of Sub-STEPS (i.e., a chain), the performance itself reveals whether:  ••A Sub-STEP is omitted  ••Sub-STEPS are performed in the wrong sequence
·		-Probing is therefore unnecessary to identify a "chaining" failure*

\*Probing for student reasons for omissions or incorrect sequences can be used.

#### DETERMINING WHEN TO PROBE AND HOW TO TIME "PROBING"

GOALS	For obtaining OBSERVATIONAL error data uninfluenced or uncontaminated by probing procedures	For obtaining responses to PROBES
ACTION TO TAKE	-Administer the entire program to one or two students of the sample  -Observe occurrences of errors but do NOT probe for nature or causes of problem at the time  -Allow student to complete the program and then go back to program problems or tasks and begin probing	-See Way #1 in the left-hand column  + -Administer the entire program to one or two students in the sample -Observe occurrences of errors and  **Before the student is given feedback  **Begin probing -Use general probes before using specific probes -When using specific probes, probe for failures in this order:  **Re: Discriminations  **Re: Generalizations  **Re: Associations

#### RATIONALE

- -Probing while the student is taking the problem will disallow an uncontaminated assessment of the capacity of the program sequence (as originally developed) to bring students up to proficiency
- -Probing immediately after an error provides clues to the student which may help him on subsequent problems

-Probing before feedback is given allows determination of whether the student has learned anything (unprompted by the feedback)

### JOB PROCEDURES

JOB PROCEDURES	
	page
SUMMARY OF PROCEDURES	46
Adequacy of "probing for sources of learning failure"	47
*	
<u> </u>	

J.1.2

## ILLUSTRATION SUMMARIZING PROCEDURES INVOLVED IN ADMINISTERING PROGRAM, RECORDING ERRORS, AND PROBING FOR SOURCE OF LEARNING FAILURE

#1

#### LOOK FOR FRRORS

- Administer instructional program individually to each student in the sample
- Observe occurrence of error(s) on program problem or task
- c. Make a record of occurrence and of the type of error\*
- d. (OPTIONAL) Use FORM J.2(1) to summarize errors on all program problems

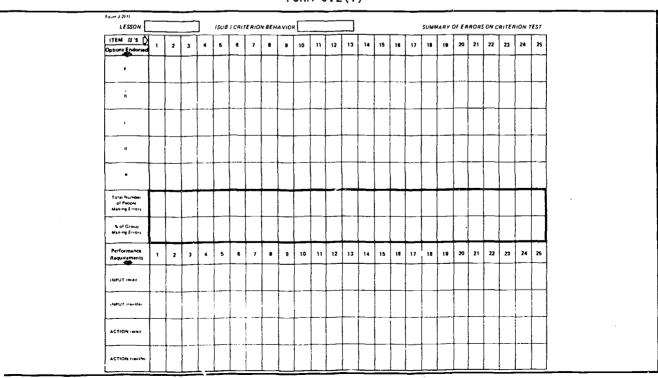

#2

#### PROBE FOR REASONS FOR ERRORS

- Use <u>general</u> probes for identifying source of errors:
  - ••Start with open-ended
    probes;
  - ••Continue with less
    open-ended probes;
  - ·· Use direct probes
- Use probes to follow up student responses to initial probes
- Use specific probes to identify specific problems

\*On printed programs a record can be kept on a copy of the program itself.

#### FORM J.2(1)

### J.1.2

### ASSESSING THE ADEQUACY OF THE OBSERVATIONAL AND PROBING PROCESS

### STANDARDS MATRIX

PROPERTIES	AVAILABILITY OF A RECORD	COMPLETENESS
CRITERIA	-A record identifying:  •All program problems or tasks on which errors have been made  •The parts of the problem on which errors have been made  (Where applicable) the incorrect options selected  -A record of responses to probes:  •On a printed program itself, or  •On paper for non-printed programs	-An attempt to identify:  ••The nature of the learning failure (which skills not learned)  ••The sources of the failure (properties of INPUTS or ACTIONS causing problems)  -An attempt to identify features of the program which can account for the failure:  ••Content (e.g., examples used)  ••Format (vocabulary, instructions, diagrams, etc.)

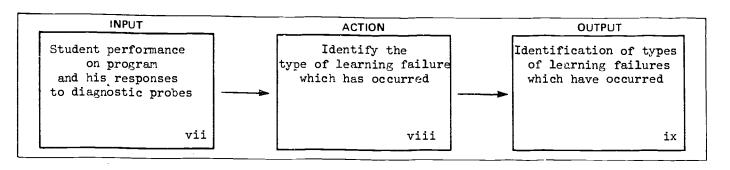

### PREVIEW OF THE NEXT SubSTEP

YOUR PRODUCT	An identification of the nature of the learning failures which have occurred for the two to five students who took the program.
WHAT YOU WILL WORK FROM	<ul> <li>(I) A record of student performance (errors) on the program.</li> <li>(2) Students' responses to diagnostic probes concerning the errors they made.</li> </ul>
WHAT YOU WILL	Identify the types of learning failures which have occurred and their sources.
FORMS YOU WILL USE	None

	•			

#### BACKGROUND INFORMATION

	page
Two major types of problems students may exhibit: format or content	52
Evidence indicating <u>format</u> difficulties	53
Evidence indicating content difficulties re: Discriminations	54
Evidence indicating content difficulties re: Generalizations	55
Evidence indicating content difficulties re: Associations	56
Evidence indicating content difficulties re: <u>Chains</u>	57

### TWO MAJOR TYPES OF DIFFICULTIES THE STUDENT MAY HAVE WITH A PROGRAM PROBLEM

TYPES 'OF PROBLEMS	CONTENT difficulties	FORMAT difficulties
CRITERIA	-The student has difficulties making or forming required:	-The student has difficulties with the format of program problem or task:  ••Fails to understand OR ••Misunderstands OR ••Ignores:  /Vocabulary  /Task instructions  /Cues designed to control attention or observing behavior  /Statement of objectives

### EVIDENCE INDICATING WHAT FORMAT DIFFICULTIES A STUDENT MAY BE HAVING WITH A PROGRAM PROBLEM

SOURCE OF EVIDENCE	OBSERVATION as a source of evidence about <u>format</u> problem difficulties	RESPONSES TO PROBING as a source of evidence about format problem difficulties
CRITERIA	-A student failure to understand instructions or a misunderstanding of instruction is indicated when the student:  ··Asks what he is supposed to do  ··Does a task other than that called for by instructions  ··Pays attention to features or elements of the problem task other than those problem instructions directed him to attend to  -A student failure to understand vocabulary is indicated when:  ··A student asks the meaning of a word	-Student indicates in response to probes that he failed to understand or that he misunderstood:  ••What task he was supposed to perform on problem  ••The vocabulary used in instructions or in the statement of problem or in the statement of objectives

	e.g.,	e.g.,
EXAMPLES	-The student carried a numerical answer out to one decimal place, having been instructed to carry it out to three places	-"I thought I was supposed to carry the answer out to one decimal place."
	-"What does 'shaping' mean?"	-"I didn't know what 'shaping' means."

### EVIDENCE SYMPTOMATIC OF CONTENT DIFFICULTIES: DISCRIMINATIONS\*

SOURCE OF EVIDENCE	OBSERVATION as a source of evidence about content difficulties	RESPONSES TO PROBING as a source of evidence about content difficulties
CRITERIA	-Commits an error on a program problem or tisk which involves only "discrimination" (e.g., a same/different type problem involving INPUTS from different classes)  -On a given problem, INPUTS from two or more different classes are presented; and the student takes the same ACTION in response to them both (all)	IN RESPONSE TO GENERAL PROBES  -Attributes membership for the example of an INPUT (which was used in the example) to the wrong class  -Attributes properties to an example which it does not have (i.e., they are properties of another class)  -Says he doesn't know which class the example belongs to  IN RESPONSE TO SPECIFIC PROBES  -When presented additional INPUT examples (from same or different classes) and asked are they the same or different, fails to distinguish between examples from different classes

<sup>\*</sup>The more items there are providing comparable evidence, the more dependable the diagnosis is.

EXAMPLES	e.g.,  -"When selecting a verb, how would you treat these two nouns:  (1) women, and (2) women?"  X the same way different way  -"Here are two nouns; make up two sentences, each one using one of the nouns and the correct form of the verb 'to be': (1) woman, and (2) women."  The woman is pretty.  The women is all here.	because 'women' is singular."  -When given additional examples of singular and plural nouns, the student incorrectly says "same"
	The women is all here.	

### EVIDENCE SYMPTOMATIC OF CONTENT DIFFICULTIES: GENERALIZATIONS\*

SOURCE OF EVIDENCE	OBSERVATION as a source of evidence about content difficulties	RESPONSES TO PROBING as a source of evidence about content difficulties
CRITERIA	-Commits an error on a program problem or task which involves only "generalization" (e.g., a same/different type problem involving INPUTS from the same class)  -On a given problem, more than one INPUT from the same class is presented; and the student takes a different ACTION in response to them	IN RESPONSE TO GENERAL PROBES  -Attributes membership for the example of an INPUT (which was used in the example) to the wrong class  -Attributes properties to an example which it does not have (i.e., they are properties of another class)  -Says he doesn't know which class the example belongs to  IN RESPONSE TO SPECIFIC PROBES  -When presented additional INPUT examples (from same or different classes) and asked are they the same or different, fails to distinguish between examples from different classes

 $\star The more items there are providing comparable evidence, the more dependable the diagnosis is.$ 

EXAMPLES	e.g., -"When selecting a verb, how would you treat these two nouns: (1) man, and (2) woman?"  X the same waydifferent way	e.g., -Student says, "I said 'women is' because 'women' is singular."
	-"Here are two nouns; make up two sentences, each one using one of the nouns and the correct form of the verb 'to be': {1} woman, and {2} man."  The man is sick.  The woman are sick.	-When given additional examples of singular and plural nouns, the student incorrectly says "same" or "different" when singular and plural are compared or when two of the same number are paired.

### EVIDENCE SYMPTOMATIC OF CONTENT DIFFICULTIES: ASSOCIATIONS\*

SOURCE OF EVIDENCE	OBSERVATION as a source of evidence about content difficulties	RESPONSES TO PROBING as a source of evidence about content difficulties
CRITERIA	-Commits an error on a program problem or task which involves only "association" (e.g., a problem in which all INPUTS and ACTIONS are given and the student is required to match them up)  -On a given problem, INPUTS from more than one class are presented and the student takes a different ACTION for each (therefore making a correct discrimination) but matches up INPUTS and ACTIONS incorrectly	IN RESPONSE TO GENERAL PROBES  -Says he knows what all the possible ACTIONS are (and can identify them) but adds that he docsn't know which one goes with which class of INPUTS  -Says he took the ACTION he did because the example in the problem is of the type calling for that ACTION  IN RESPONSE TO SPECIFIC PROBES  -When given all the INPUT classes and all the possible ACTIONS, pairs them up incorrectly

\*The more items`there are providing comparable evidence, the more dependable the diagnosis is.

the diagno	osis is.	
EXAMPLES	e.g.,  -"Match up these verbs and nouns:"  B man A. is  A men B. are  -"Make up a sentence for each of these nouns and use the correct form of the verb 'to be': (1) the man, and (2) the boys."  The man are all right.  The boys is here today.	e.g., -"I know some nouns get 'is' and some get 'are,' but I don't know whether it's the singular nouns or the plural nouns which get one or the other."
J		<u> </u>

### EVIDENCE SYMPTOMATIC OF CONTENT DIFFICULTIES: CHAINS

SOURCE OF EVIDENCE	OBSERVATION as a source of evidence about content difficulties	RESPONSES TO PROBING as a source of evidence about content difficulties
	-The student omitted a Sub-STEP in the chain -The student performed all the	IN RESPONSE TO <u>GENERAL</u> PROBES  -Indicates he forgot what do do at a particular point  -Indicates that he was confused
CRITERIA	Sub-STEPS in the chain but in the wrong sequence	about which Sub-STEP followed at a particular point  IN RESPONSE TO SPECIFIC PROBES
	-The student performs a Sub-STEP which is not a part of the chain	-When Sub-STEPS are identified for him, he incorrectly identifies the required sequence

	e.g.,	e.g.,
	-The music student failed to make a "repeat"	-"I don't remember what comes next."
EXAMPLE	-The music student played the "repeat" but at the wrong place in the music	-"I don't know which one of the variations should be played right now."
	-The music student makes a "repeat" which is not called for	
		·

J.1.3

### ILLUSTRATION SUMMARIZING PROCEDURES INVOLVED IN INTERPRETING STUDENT DIFFICULTIES OCCURRING ON PROGRAM PROBLEMS OR TASKS

#1

For each program problem on which an error is made,

#### REVIEW

- a. Observational data (obtained from students who were interviewed after completing the whole instructional sequence) for:
  - ••Type of problem and
    type of error made
  - Number of students making errors
- b. Probing data obtained from all tryout students

#2

For each program problem on which an error is made,

#### IDENTIFY

- a. The probable type of content difficulty:
  - ·· Discriminations,
  - ·· Generalizations,
  - .. Associations, OR
  - ··Chains
- b. The properties of INPUTS or ACTIONS which are the source of the difficulty
- c. The probable type of problem format difficulty:
  - · · Vocabulary
  - ·· Instructions
  - · · Statement of objectives
  - ··Other cues

### J.1.3 STANDARDS MATRIX

### ASSESSING THE ADEQUACY OF PROCEDURES FOR INTERPRETING STUDENT DIFFICULTIES ON PROGRAM PROBLEMS OR TASKS

PROPERTIES	COMPREHENSIVE	DATA-BASED
CRITERIA	-Interpretation of error(s) on a program problem attends both to:  ··Content difficulties  ··Format difficulties  -Content difficulties are, in addition, further explored for:  ··Properties of INPUTS and/or ACTIONS which account for the difficulty  -Content difficulties are explored to determine whether:  ··No learning has occurred OR  ··Incorrect learning has occurred	-Interpretation is based on data obtained from the entire tryout sample:  . More weight is given to a diagnosis based on what most of the tryout sample does or says  -Interpretation is based on all available data about a program problem:  . Observational data . Probing data

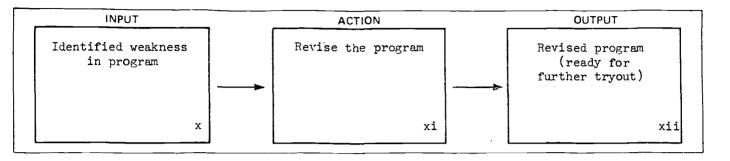

### PREVIEW OF THE NEXT SubSTEP

YOUR PRODUCT	A program which has been revised on the basis of tryout results.

Interpretation of learning failures	J.1.3	FORM J.2(1) carried forward from	J.1.3	
			_	
2.				

### BACKGROUND INFORMATION

	page
Extent of program weakness: Errors on individual vs. cumulative series of program problems	66
Sources of program weakness likely to be associated with programs which are weak to differing extents	67
How to revise <u>individual</u> program problems which result in errors	68
Two sources of program weakness associated with errors on a series of program problems	69
Four types of program "leanness" which may account for errors on a series of program problems	70
How to revise program problems to make them <u>less</u> lean	71
Criteria for determining priorities in the kinds of revisions which are made in the instructional program	72
Priorities in revising a series of program problems in order to make them less lean	73

### EXTENT OF PROGRAM WEAKNESS

EXTENT OF PROGRAM WEAKNESS	Errors are made on INDIVIDUAL program problems	Errors are made on a CUMULATIVE SERIES of program problems
	-An informal record of errors or FORM J.2(1) filled out reveals that errors are made on:  ••Isolated program problems or	-An informal record of errors or FORM J.2(1) filled out reveals that errors are made on:  •• A sequential scries of program
00.1750.14	tasks	problems
CRITERIA	<ul> <li>Problems involving different skills within the same portion of a chain</li> </ul>	••Problems involving different examples related to the <u>same</u> skill being taught
	<ul> <li>Problems involving widely separated portions of a chain</li> </ul>	••Problems involving adjacent portions of a chain
	<ul> <li>Problems involving preparatory behaviors or criterion behaviors but usually not both</li> </ul>	<ul> <li>Problems usually involving both the criterion behaviors and preparatory behaviors</li> </ul>

## SOURCES OF PROGRAM WEAKNESS LIKELY TO BE ASSOCIATED WITH ERRORS ON INDIVIDUAL PROGRAM PROBLEMS AND ON A CUMULATIVE SERIES OF PROGRAM PROBLEMS

EXTENT OF PROGRAM WEAKNESS	Sources of program weakness likely to be associated with isolated INDIVIDUAL program problems	Sources of program weakness likely to be associated with a CUMULATIVE SERIES of program problems
CRITERIA	-Program FORMAT  ··Vocabulary too difficult  ··Instructions unclear or confusing  ··Attention-controlling techniques inadequate  -Program CONTENT  ··Assistance provided (i.e., cues) makes an inadequate identification of INPUTS or ACTIONS required for successful problem solution	-Program CONTENT  ••The instructional sequence is excessively lean  ••Frerequisite behavior is wrongly assumed to be in student's repertoire  ••Prerequisite behavior to be taught in the program is taught in the wrong sequence (i.e., not taught before the criterion behavior in question as it should be)  ••Prerequisite behavior to be taught in the program is not adequately taught

### DETERMINING HOW TO REVISE AN INDIVIDUAL PROGRAM PROBLEM ON WHICH ERRORS ARE MADE\*

CONDITIONS	Error is due to FORMAT characteristics (as revealed in Sub-STEP J.1.3)	Error is due to CONTENT characteristics (as revealed in Sub-STEP J.1.3)
ACTION TO TAKE	-Change vocabulary level and readability level to make it more suitable to the target audience:  ··Shorter, more commonly used words  ··Shorter sentences -Change problem or task instructions making them:  ··Clearer, less ambiguous  ··Easier to understand -Change attention or observation controlling devices to make them work more effectively:  ··Simplify the devices  ··Make features more prominent	-Increase the strength of assistance:  ••Make the identification of INPUTS and ACTIONS more direct  /If no identification is made, provide an indirect identification  /If identification is already indirect, make it less indirect  /Only in a beginning problem in a series should an indirect identification be replaced by a direct one (See SECTION G, pages 90-95)

\*When two or more of the informal tryout sample (of five or six students) make an error on the problem

### EXAMPLES

e.g.,

Informal tryout has revealed that students did not know the meaning of a (non-technical) word and a word not included in the objectives for the instructional sequence

Original word used was "emasculate." Change to "weaken" or "unnerve."

e.g.,

A diagram was used to control the observing behavior of the student; students did not know how to use it

Change instructions so that students know where to enter the diagram, what to look at first, what to look for, what to do next, etc.

#### e.g.,

The practice problem offers no identification of the ACTION (which is required)

- -The student is required to use a verb (other than those used in prior examples) and to use the correct form for the subject noun given him. No assistance is given him.
- -On revision he is given the indirect identification--another noun and another verb: "The man walks to work."
- -In his new problem task he is given the subject noun "the dog" and is required to make up a sentence in the present tense using another varb. The example given him, i.e., "walks," provides indirect or partial identification

## TWO MAJOR TYPES OF PROGRAM WEAKNESS ASSOCIATED WITH CONTENT DIFFICULTIES IN A SERIES OF PROGRAM PROBLEMS

TYPES OF PROGRAM WEAKNESS	EXCESSIVE LEANNESS	PREREQUISITE BEHAVIORS not in student's repertoire
CRITERIA	-The instructional program which has been prepared is too lean resulting in content difficulties	-Student difficulties are due to the absence from the student's repertoire of other criterion behaviors which are prerequisite to the learning of the criterion behavior in question  -This may be due to one of two conditions:  • Students did not have prerequisite behaviors to begin with as may have been assumed  • If the prerequisite behavior is taught in the program, its sequencing relative to the criterion behavior in question is at fault

		-Analysis of this type of weakness requires the use of data not available during informal tryout
FOR DETAIL	See next page	-Sequencing changes are therefore made during developmental tryout
		See STEP J.2
		<u> </u>

"LEANNESS" OF AN INSTRUCTIONAL SEQUENCE IS A FUNCTION OF FOUR PROGRAM VARIABLES

IDENTIFICATION MATRIX

3.1.4

4 NUMBER OF PRACTICE PROBLEMS provided in the instructional sequence	-The fewer the practice problems in the whole sequence, the leaner the program
3 SPEED OF FADING OF ASSISTANCE	-The more quickly assistance is withdram the leaner the program -The more quickly the degree of assistance is weakened, the leaner the program
2 DEGREE OF ASSISTANCE provided	-The less direct assistance is in a given program problem or in a series of program problems, the leaner the sequence of assistance is from most to least lean:  .No assistanceIndirect assistanceDirect assistance
I SIZE OR AMOUNT of criterion behavior practiced at the same time	The larger the unit of practice (i.e., the more of the criterion behavior practiced at the same time), the leaner the sequence of a program for the following "units" is from most to least lean:  • Practice of a group of two or more sub-STEPS  • Practice of component skills within a sub-STEP  • Practice of the substills within a sub-STEP  • Practice of the substills component skills within a sub-STEP
VARIABLES	CRITERIA

"I" page 54	
"I" page 53	
"I" page 52	
"I" page 12	
SECTION	

DETERMINING HOW TO REVERSE THE LEANNESS OF A PROGRAM SEQUENCE

DECISION MATRIX

4 NUMBER OF PRACTICE PROBLEMS provided in the instructional sequence	-Create a sequence in which there are more practice problems than in the program just tried out:  ••Add extra problems into a sequence
3 SPEED OF FADING OF ASSISTANCE	-Create a sequence in which assistance is faded out less abruptly than in the program just tried out:  ••Continue assistance problems before:  /Weakening it (making it less and less direct) OR /Removing it altogether
2 DEGREE OF ASSISTANCE provided	-Create a sequence in which assistance is less lean than that just used in the program which was tried out:  • If no assistance was provided, provided, provided indirect assistance was provided, provide still less indirect assistance still less indirect assistance indirect assistance assistance  • Finally, provide direct assistance
SIZE OR AMOUNT of criterion behavior practiced at the same time	-Create a sequence which is one step down the the one just tried out:  -If two or more sub-STEPS were sequence the number of sub-STEPS were practiced together, sequence practiced together, sequence practiced together, sequence practice of a combination of component skills were practice of sequence of skills were practice of component skills were practice of skills were practice of skills were practice of component skills were practice of component skills were practice of skills were practice of component skills were practice of skills were practiced were provided were practiced were provided were
VARIABLES	ACTION TO TAKE

Do  $\underline{not}$  in the first revision reverse the leanness of the program too quickly or too much by any of these approaches. See next page for priorities in the use of these four approaches.

CAUTION

3.1.4

# CRITERIA FOR DETERMINING PRIORITIES IN WAYS TO REVISE INSTRUCTIONAL SEQUENCES IN ORDER TO MAKE THEM LESS LEAN

VARIABLES	EFFICIENCY of an instructional sequence	EFFECTIVENESS of an instructional sequence
CRITERIA	-Revision should be consistent with the efficiency of the instructional sequence; the sequence is more efficient:  • The shorter it is (i.e., the fewer problems there are),  • The less time it takes to complete  -Revision should keep the instructional sequence as lean as is possible, consistent with "EFFECTIVENESS"  -Revision should not add any more than is required  -Accordingly, each cycle of revision should make minimal changes away from leanness	-Revision must result in an instructional sequence which now produces minimal number of errors:  ••Few program problems produce errors  ••Few students out of total tryout population make errors on program problems  -Revision should be geared to the type of learning difficulties occurring—but consistent with the criterion of "EFFICIENCY"

### J.1.4 DECISION MATRIX

### DETERMINING PRIORITIES AMONG THE FOUR WAYS TO REVISE PROGRAM SEQUENCES TO MAKE THEM LESS LEAN

PRIORITIES	lst priority	2nd priority	3rd priority
	occurring in the	occurring in the	occurring in the
	FIRST	SECOND	THIRD
	revision cycle	revision cycle	revision cycle
ACTION TO TAKE	-Keep "the AMOUNT of criterion behavior practiced at the same time" unchanged -Consider one or more of the following approaches:  • Strengthen the degree of assistance to the program problems already in the sequence and/or remove assistance less early in the sequence  OR  • Introduce new program problems to the sequence providing more examples (new or repetitions)	program problems appropriate to the skills with which students have difficulties. (Intersperse the new problems among the existing problems)  -Also consider strengthening the	IF THE THIRD TRYOUT STILL PRODUCES ERRORS ON A SERIES OF PROGRAM PROBLEMS:  -Reduce the amount of criterion behavior practiced at the same time (one level lower on each successive revision)  -Also consider adding new program problems

#### EXAMPLES

SEE SECTION "I," PAGES 73-96
FOR EXAMPLES OF PROGRAM SEQUENCES
DIFFERING IN "AMOUNT" OF CRITERION BEHAVIOR
PRACTICED AT THE SAME TIME

# REVISING PROGRAM PROBLEMS FOR SPECIFIC TYPES OF LEARNING DIFFICULTIES

r	
	page
How revising "assistance" and "number of program problems" is used in order to overcome specific learning difficulties with individual program problems either "isolated" or "part or a series of problems"	76, 77
Ways to revise program to overcome "discrimination" difficulties	78
Ways to revise program to overcome "generalization" difficulties	79
Ways to revise program to overcome "association" difficulties	80
Ways to revise program to overcome "chaining" difficulties	81

# HOW REVISION OF "DEGREE OF ASSISTANCE" AND OF "NUMBER OF EXAMPLES" IS USED TO OVERCOME DIFFICULTIES IN A PROGRAM PROBLEM\*

TYPE OF	STRENGTHENING	ADDING
REVISION	The degree of assistance	NEW PROGRAM PROBLEMS
CRITERIA	-Cues or prompts are added which provide more direct identifications of:  "INPUTS/OUTFUTS to be discriminated and/or the properties which form the basis for the discrimination  "INPUTS/OUTPUTS requiring generalization and/or the properties which form the basis for the generalization  "Which ACTION goes with which INPUT (associations)  "The sequence of associations to be chained	-New program problems are added or old problems are repeated giving the student additional practice:  • Discriminating between new/old examples of INPUTS (or OUTPUTS)  • Generalizing across new/old examples of INPUTS (or OUTPUTS)  • Associating new/old examples of INPUTS with ACTIONS  • Producing a chained sequence of associations

\*These revision approaches apply both to isolated problem problems (on which errors occur) or on program problems which are part of a series

EXAMPLES SEE PAGES 77-81

### TWO APPROACHES TO CONSIDER IN MAKING REVISIONS

APPROACHES	Use the SAME practice progression selected in TASK "G" appropriate to the learning difficulties	Consider using NEW practice progression appropriate to the learning difficulties
CRITERIA	-The strengthening of assistance or the addition of new examples is done within the framework of practice progressions selected in TASK "G"  SEE PAGES 71-149 IN SECTION "G" OF THE HANDBOOK	-The strengthening of assistance or the addition of new examples is done within the framework of new practice progressions selected now as a means of reducing learning difficulties  -The new progressions are selected because of empirical evidence that the difficulty is greater than initially anticipated

EXAMPLES	e.g.,  -The progression selected originally was a "mode" progression involving only editing and production practice; to add to this, recognition practice might also be included to make the sequence easier  -A sequence devoted to practice of discriminations initially used paired examples—first differing widely, then gradually narrowed. The revision might include additional problems in which the reduction in differences between pairs is still more gradual	
----------	---	--

## WAYS TO REVISE A PROGRAM SEQUENCE AS A MEANS OF OVERCOMING "DISCRIMINATION" DIFFICULTIES

REVISION APPROACHES	Adding ASSISTANCE within an already selected progression *	Adding PROBLEMS within an already selected progression	Using <u>other</u> progressions which are appropriate
CRITERIA	-Providing as a model contrasting examples of INPUTS which belong to a class and those which do not  -Providing as a model contrasting examples of INPUTS which belong to different classes  -Providing verbal rules which identify when one class begins and another leaves off  -Using cues (visual or verbal) calling attention to properties which determine whether INPUTS belong to one class or another	INPUTS from different classes are used (and about which the student practices making relevant discriminations)	-Providing recognition practice in which pairs of examples belonging to different classes and to the same class are contrasted and/or compared (Progression b)  -Using diagrams to highlight the differences between classes (Progression i)  -Using widely contrasting examples and gradually narrowing differences to permit fine discriminations (Progression k)

\*These two approaches are often combined.

FOR EXAMPLES SEE PAGES	94-95 in SECTION "G"	109-113 in SECTION "G"	See Sub-STEP G.2.1 in SECTION "G"

## WAYS TO REVISE A PROGRAM SEQUENCE AS A MEANS OF OVERCOMING "GENERALIZATION" DIFFICULTIES

REVISION APPROACHES	Adding ASSISTANCE within an already selected progression *	Adding PROBLEMS within an already selected progression *	Using <u>other</u> progressions which are appropriate
CRITERIA	-Providing as a model contrasting examples of INPUTS which belong to a class and those which do not -Providing as a model pairs of comparable INPUTS which belong to the same class -Providing verbal rules which identify when one class begins and another leaves off -Using cues (visual or verbal) calling attention to properties which determine whether INPUTS belong to one class or another	INPUTS from the same class are used (and about which the student practices making relevant generalizations)	-Providing recognition practice in which pairs of examples belonging to different classes and to the same class are contrasted and/or campared (Progression b)  -Using diagrams to highlight the similarities within a class (Progression i)

\*These two approaches are often combined

FOR EXAMPLES SEE PAGES	94-95 in SECTION ''G''	109-113 in SECTION "G"	See Sub-STEP G.2.1 in SECTION "G"
		· .	

## WAYS TO REVISE A PROGRAM SEQUENCE AS A MEANS OF OVERCOMING "ASSOCIATION" DIFFICULTIES

REVISION APPROACHES	Adding ASSISTANCE within an already selected progression	Adding PROBLEMS within an already selected progression *	Using <u>other</u> progressions which are appropriate
CRITERIA	-Providing as a model an example from each INPUT class and the ACTION to be associated with it (to be done for all classes) -Providing a verbal rule indicating how INPUT and ACTIONS are associated	-Providing additional program problems with which the student gains further practice in associating INPUTS and ACTIONS:  • Repetition of old (INPUT) examples OR • New (INPUT) examples	when given an INPUT, the student merely has to select a correct ACTION from two or more options (Progression b) -Using diagrams to give an overview of

\*These two approaches are often combined.

FOR EXAMPLES SEE PAGES	94-95 in SECTION "G"	109-113 in SECTION "G"	See Sub-STEP G.2.1 in SECTION "G"

## WAYS TO REVISE A PROGRAM SEQUENCE AS A MEANS OF OVERCOMING "CHAINING" DIFFICULTIES

REVISION APPROACHES	Adding ASSISTANCE within an already selected progression *	Adding PROBLEMS within an already selected progression *	Using other progressions which are appropriate
	-Providing a model performance of the whole chain which the student can imitate  -Providing verbal rules indicating the proper sequence in which the separate associations are chained  -Providing verbal or visual cues which help identify which association is next up in the sequence	-Providing additional practice in producing the whole chain	-Providing recognition practice in which the student has to select from options which association comes next in the chain (Progression b)  -Using diagrams to give an overview of a conceptual chain or a flow pattern of a procedural chain (Progression i)

<sup>\*</sup>These two approaches are often combined.

### JOB PROCEDURES

## ASSESSING THE ADEQUACY IN APPROACH TO REVISION OF IDENTIFIED PROGRAM WEAKNESSES

PROPERTIES	l	2	3
	Data-Based	EFFECTIVENESS	EFFICIENCY
CRITERIA	-Revisions made are closely geared to errors identified from -Observational data:	cyclical revision is relatively error-free; i.e., errors are made on fewer than 15-20%	Column #2) fail in early revisions

### COMPLETION CHECKLIST

Enter proficiency of informal tryout sample  Errors on program Administration of instructional program  Interpreted nature of learning failures  Revised version of program  Revised version of program	IDENTIFIED	PERFORMED	PRODUCED	FORMS COMPLETED
Interpreted nature of learning failures  Revised version of	f informal tryout			
Interpreted nature of learning failures  Revised version of	rrors on program			FORM J.2(1)
of learning failures  Revised version of				(optional)
		Interpreted nature of learning failures		

J.2

Conduct a developmental tryout of the instructional program and relise the program when necessary.\*

J.2.1

Administer the criterion and sub-criterion tests to a representative sample of the target population as a "before" test.

J.2.2

Administer the instructional program to the representative sample and identify the portions of the program on which errors are made.

J.2.3

Administer criterion and sub-criterion tests to the representative sample as an "after" test, identify errors, and, whenever possible, interpret learner difficulties which have resulted in errors.

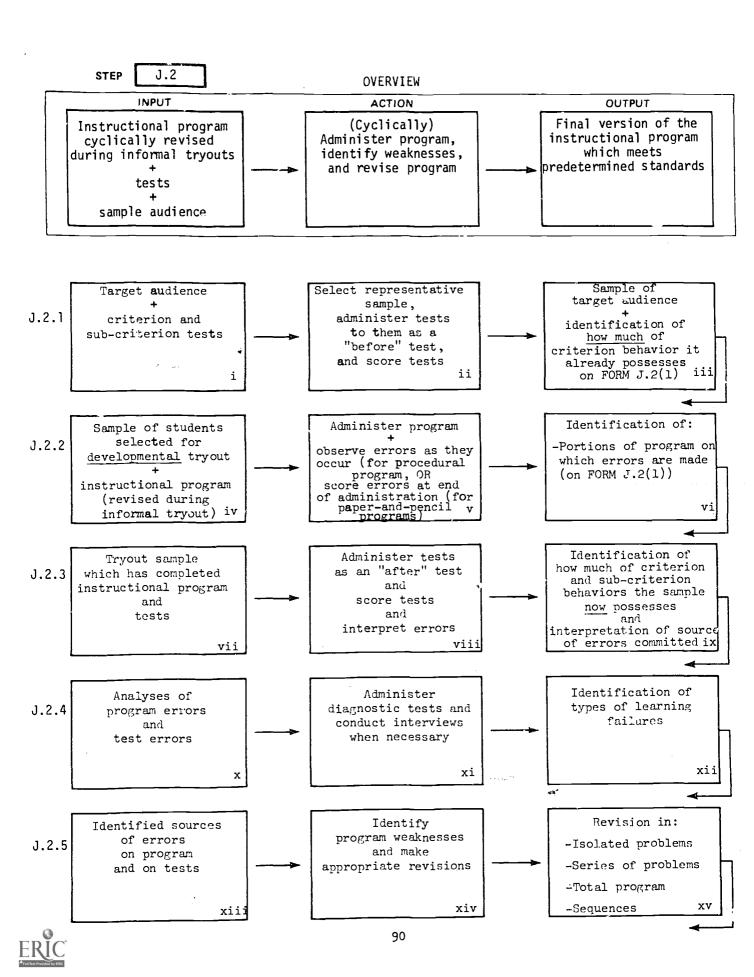

J.2.4

Administer diagnostic tests and/or conduct interviews to identify learner difficulties which have resulted in the errors which have been made.

J.2.5

Make revisions in the instructional program based on program and test error data and on identified sources of errors.

<sup>\*</sup>The cycle of Sub-STEPS J.2.1, J.2.2, J.2.3, J.2.4, and J.2.5 should be repeated until a predetermined standard of performance is attained by a predetermined percentage of a representative sample.

### J.2.1 DECISION MATRIX

### DETERMINING "BEFORE" PROFICIENCY BASED ON THREE TYPES OF INFORMATION

TYPES OF MEASURES	Proficiency on INDIVIDUAL test items	Proficiency on all test items related to each SUB-CRITERION behavior	Proficiency on all test items related to each CRITERION behavior
ACTION TO TAKE	-Record on FORM J.2(1) the number of students making an error on each test item -(For multiple choice test items, enter number of students selecting each wrong option) -Express the number (of students making errors) as a percent of the total sample; enter on "percent" row of FORM J.2(1)	FORM J.2(1), add the percentages for all test items related to each sub-criterion behavior  -Divide this sum by the number of test	from the "percent" row on FORM J.2(1), add the percentages for all test items related to the CRITERION behavior -Divide this sum by the number of test items related to the CRITERION behavior -This produces an average error score

EXAMPLE (See opposite page)	-The number of people making an error on each test item is filled in in the first row; e.g., 24 students made an error on Item #4	-Test items 10-15 all relate to sub-criterion behavior #2 -The sum of the percentages for each of these items (48, 56, 60, 36, 52, and 44) equals 296 -There are 6 items -296 divided by 6 yields an average error rate of 49% on all items related to this sub-criterion behavior -This means that 51% of the sample is proficient at this sub-criterion behavior	-The sum of the percentages for each of these items (90, 96, 96, and 84) equals 366 -There are 4 items -366 divided by 4 yields an average error rate of 91% on all items related to the CRITERION behavior -This means that 09% of the sample is proficient at the CRITERION behavior
-----------------------------------	---	--	--

Items 22-25 al! measure proficiency at the CRITERION BEHAVIOR			. <b>.</b> '''	Average error*** across test items for: Sub-Criterion #1		x = 49%	Sub-Criterion #3 x = 82%	X = 91%	***in percentages (of the sample)

#### #1

#### SELECT SAMPLE

- a. Select sample of approximately
   25-50 students from the target audience
- b. Make sure sample is representative\* (random selection can assure this)

See Sub-STEP J.1.1 for discussion of sample selection.

#### #2

### ADMINISTER AND SCORE TESTS

- Administer sub-criterion tests and criterion tests to sample
- b. Score tests
- c. Record error results by test items on top half of FORM J.2(1)

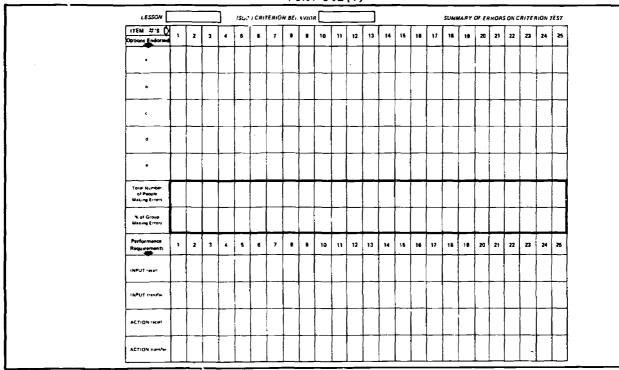

See Sub-STEP J.1.2 for discussion of use of FORM J.2(1).

#### #3

### IDENTIFY "BEFORE" PROFICIENCY

- a. Review scores for all test items related to each sub-criterion behavior
- b. Sum results for each sub-criterion behavior
- c. Determine which students are already proficient at the sub-criterion behavior and how many of the total group are proficient
- Repeat a-c for each sub-criterion behavior and for the criterion behavior

### FORM J.2(1)

\*Proficiency at criterion behavior may range from zero to 100%.

### J.2.1 STANDARDS MATRIX

## ASSESSING THE ADEQUACY OF SAMPLE SELECTION AND ADMINISTRATION OF "BEFORE" TESTS

PROPERTIES	SAMPLING adequacy	SCOR I NG adequacy
CRITERIA	-Sample size:  ••Sample consists of approximately 20-25  -Sample representativeness; sample compares with the target audience in:  ••Range of general ability  ••Range of specific abilities (relevant to mastery of the criterion behavior)  ••Range of entering proficiency on the criterion behavior	

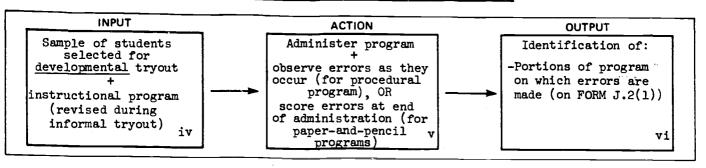

### PREVIEW OF THE NEXT SubSTEP

YOUR PRODUCT	A record of the percentage of students in the sample who make errors on each part or problem in the program.
WHAT YOU WILL WORK FROM	<ul><li>(1) Sample of approximately 25 students</li><li>(2) The instructional program (revised on the basis of informal tryouts)</li></ul>
WHAT YOU WILL	<ul> <li>(1) Administer the program</li> <li>(2) Score and identify errors</li> <li>(3) Compute percentage of errors made on individual problems and on the whole program</li> </ul>
FORMS YOU WILL	FORM J.2(1) for recording errors on the instructional program.

SUMMARY OF PROCEDURES	104
Assessing adequacy of identification of errors committed on program	105

J.2.2

#1

#### ADMINISTER PROGRAM

- Administer instructional program to entire tryout sample:
  - ••Simultaneously to all, if the program is on paper-and-pencil
  - ••One-by-one if
     the program
     involves a set
     of procedures

#2

### OBSERVE AND/OR SCORE ERRORS

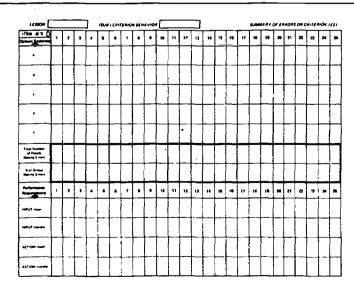

- a. Score errors for each (paper-and-pencil) program problem after program completion
- b. For "procedural" programs, observe practice and make a record of problems on which errors are made
- c. Make a record of program problems or program parts on which errors are made (on FORM J.2(1))

#3

### IDENTIFY PROFICIENCY

- a. Compute percentages total sample makes errors on
  - •• Each program problem
- b. Identify percentages on those
  program problems
  which provide no
  assistance and
  are a test of the
  sub-criterion
  behavior
- c. Identify percenages on those program problems which provide no assistance and are a test of the CRITERION behavior

FORM J.2(1)

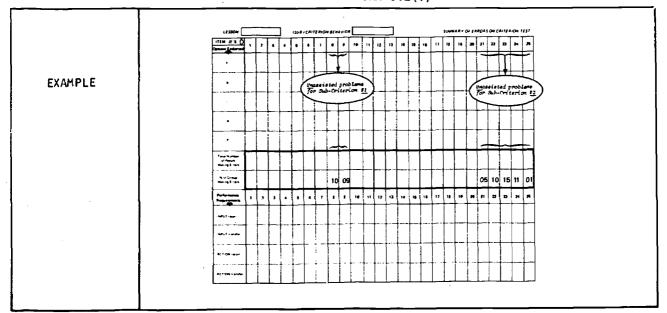

J.2.2 STANDARDS MATRIX

### ASSESSING THE ADEQUACY WITH WHICH PROGRAM ERRORS ARE IDENTIFIED

PROPERTIES	COMPLETENESS OF RECORD	DIAGNOSTIC CAPABILITY
CRITERIA	On FORM J.2(1) there is a record indicating the percentage of students  Making errors on each program problem or program task  Making errors on problem parts (for multipart problems)  Making errors by selecting specific wrong options (on multiple choice program problems)	On FORM J.2(1) there are identifying marks which indicate  "Which program problems provide no assistance and are therefore tests of each sub-criterion behavior  "Which program problems provide no assistance and are therefore parts of the CRITERION behavior

## BACKGROUND INFORMATION

	FIVE TYPES OF DIAGNOSIS	page
Α.	ASSESSING PROFICIENCY	112-116
В.	INTERPRETING ERRORS ON THE BASIS OF GROUP RESULTS ON INDIVIDUAL TEST ITEMS	117-124
c.	INTERPRETING ERRORS ON THE BASIS OF RESULTS OF INDIVIDUAL STUDENTS ON MULTIPLE TEST ITEMS	125-150
D.	USE OF "DELAYED" TESTING	151-154
Ε.	ASSESSING SEQUENCING DECISIONS	155-158

## A. ASSESSING PROFICIENCY

	page
Purposes in comparing results on tests administered "before" and "after" administration of instructional program	113
How to use FORM J.2(2) for recording error patterns	114
Purposes in recording "by items," "by groups of items," and "by students"	115
Two methods for interpreting errors: by results on individual items and by patterns on groups of items	116

# J.2.3 IDENTIFICATION MATRIX

# PURPOSES IN COMPARING RESULTS ON TESTS ADMINISTERED "BEFORE" AND "AFTER" STUDENTS TAKE THE INSTRUCTIONAL PROGRAM

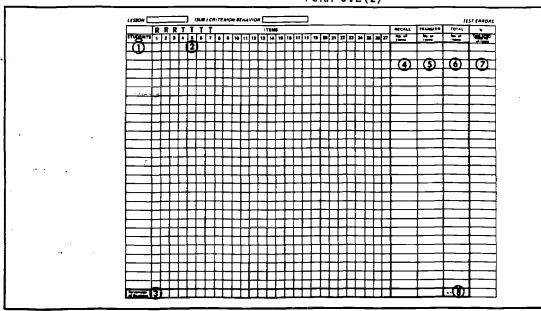

PURPOSES	ASSESSING THE EFFECTIVENESS OF THE INSTRUCTIONAL PROGRAM	IDENTIFYING WHICH STUDENT RESULTS TO USE AS A BASIS FOR PROGRAM REVISION
CRITERIA	-Without "before" results to be used for baseline data, it is not possible to assess the adequacy of the instructional program in producing efficiency: If, for example, proficiency were high to begin with, high proficiency on the after test would not be as meaningful as it would be if there were low proficiency to begin with  -"Before" test results can be used to identify students with low entering proficiency and to determine what the program does for them	-Students who tested low "before" taking the program and who test low (i.e., make more errors) "after" taking the program can provide the sample of results which can be interpreted and used as a basis for program revision

HOW TO USE FORM J.2(2) TO RECORD ERRORS ON TESTS ADMINISTERED "BEFORE" AND "AFTER" STUDENTS TAKE THE INSTRUCTIONAL PROGRAM

TYPE OF	INDIVIDUAL	"TOTAL"
ENTRIES	entries	entries
	<ol> <li>Use each row to record the errors each student makes on the test.</li> <li>Use each column to record the item(s) on which error(s) is (are) made.</li> <li>Use the summary box to record the number of students making predetermined percentage of errors:         <ul> <li>20% or more is recommended</li> </ul> </li> </ol>	3. Use the bottom row to record the percentage of students making an error for each test item.  4. Use the "RECALL" column to record the total number of errors each student made on all RECALL items.*  5. Use the "TRANSFER" column to record the total number of errors each student made on all TRANSFER items.*  6. Use the "TOTAL" column to add the number of RECALL and TRANSFER errors for each student.  7. Use the % column to express for each student the percentage of errors he made on all items.

\*Individual items should be coded by an R (RECALL) or by a T (TRANSFER) (See example below) FORM J.2(2)

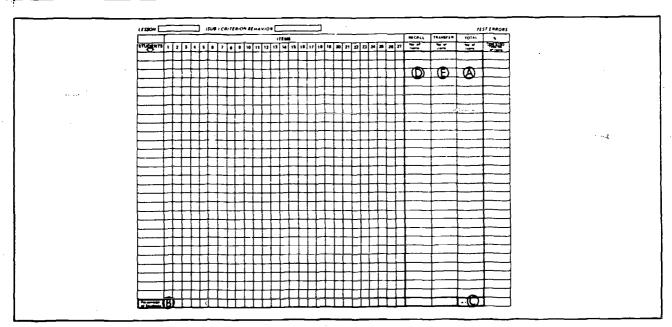

# J.2.3 IDENTIFICATION MATRIX

## PURPOSES IN RECORDING ERRORS: BY ITEMS, BY GROUPS OF ITEMS, AND BY STUDENTS

METHODS OF	By	By	By
TOTALING	INDIVIDUAL	GROUPS	GROUPS
ERRORS	STUDENTS	OF STUDENTS	OF ITEMS
CRITERIA	A. Summing errors for each student (in a row) permits:  ••The assessment of the degree of proficiency (or lack of it) he has attained on the basis of taking the instructional program  ••The identification of which students to select for further analysis of error patterns	B. Summing errors for each test item (in a column) permits a determination of what percentage of students failed that particular item (This may point to need for program revision, particularly if it is a RECALL item, i.e., something covered in the instructional program)  C. The number of students exceeding a predetermined error rate identifies the degree of need of program revision results	D. Summing errors by RECALL items only and  E. By TRANSFER items only permits an identification of how to program has failed:  ••On transfer only  ••On recall and transfer both

# J.2.3 IDENTIFICATION MATRIX

## TWO METHODS FOR ANALYZING ERRORS AS A BASIS FOR DIAGNOSING PROBLEMS

METHODS	Analysis of group results on  ••INDIVIDUAL items  ••GROUPS of items	Analysis of results of individual students on ••MULTIPLE items
CRITERIA	-Identification of individual test items failed by a predetermined percentage of students -Identification of specific types of items failed by a predetermined percentage of students:  ••RECALL items ••TRANSFER items -Identification of total error scores	-Analysis of the pattern of errors made by individual stulents  **Does the same student make the same or different type of error on:  /Multiple items  /RECALL/TRANSFER items

## B. USE OF GROUP RESULTS TO ASSESS PROFICIENCY

	page
Three types of GROUP measures useful in assessing proficiency and in identifying the need for revision	118
How to interpret GROUP error scores on total test	119
How to interpret GROUP error scores on RECALL and TRANSFER items	120
How to deal with GROUP error scores on individual test items	121
Analyzing GROUP error scores on individual test items	122, 123

# J.2.3 IDENTIFICATION MATRIX

## THREE TYPES OF "GROUP" MEASURES USEFUL IN ASSESSING PROFICIENCY AND IN IDENTIFYING THE NEED FOR PROGRAM REVISION

TYPES OF	Group error score on:	Group error score on:  ••All RECALL items	Group error score on:
MEASURES	••TOTAL test	••All TRANSFER items	··INDIVIDUAL test items
	Computation of a group error score involves:	Computation of a group error score involves:	Computation of a group error score involves:
CRITERIA	-Summing the number of errors for each student on all test items covering a sub-criterion behavior or a criterion behavior -Expressing (for each student) the number of errors he made as a percentage of the total number of errors possible (total number of test items) -Counting the total number of students exceeding a predetermined error percentage and expressing that number of students number as a percentage of the total number of students taking the test	errors for each student on all RECALL items separately and on all TRANSFER items separately -Expressing for each student the number of RECALL (TRANSFER) errors he made as a percentage of the total number of RECALL (TRANSFER)	Summing the number of students for each test item  -Expressing the sum (of students) as a percentage of students making errors on that item
SEE PAGE	119	. 120	121
EXAMPLES	e.g.,  -Student #1 - Made errors on 5 test items out of a total of 50 items, for an error rate of 10%  -Student #2 - Made errors on 10 items, for an error rate of 10%  -Student #n - Made X errors for an error rate of y%  -15 out of 50 students had an error rate of 20% or more  -30% of the students	e.g.,  -Student #1 - Made no errors on the 20 RECALL items, for an error rate of 0%, and 5 errors on the 30 TRANSFER items, for an error rate of 17%  -Student #n had an error rate on RECALL items of X% and on TRANSFER items of V%  -5 out of 50 students (or 10%) had a RECALL error rate of 20%  -20 students out of 50 (or 40%) had a	e.g., -On test item #1, 20 students out of 50 students, or 40% of the whole group, made errors

## DETERMINING HOW TO INTERPRET GROUP ERROR SCORES ON TOTAL TEST

CONDITIONS	A HIGH percentage of students score below a predetermined error rate on TOTAL test*	A HIGH percentage of students score above a predetermined error rate on TOTAL test*
ACTION TO TAKE	-Consider the program in reasonably good shape  -Review the RECALL and TRANSFER scores to determine whether the errors which do occur divide up between the two types of items:  • Evenly, OR  • Unevenly  (See page 120 for next steps to take)  -Review the error rates for individual test items to determine if there are unusually high error rates for particular items  (See page 121)	

\*Which predetermined error rate is selected is arbitrary; a 20 percent rate is a convenient and often used rate.

	e.g.,	e.g.,
EXAMPLES	-In a tryout sample of 40 students, 90% of the students had error rates of 19% or less	-In a truout sample of 40 students, 40% of the students had error rates of 20% or more
	-Further review of results would be conducted to identify specific types of learning failure which could serve as the basis for modest program revision	-Detailed review of group results and of results for individual students (on multiple test items) appear in order as a means of identifying the learning failures which have occurred
	·	
	<u></u>	

## DETERMINING HOW TO INTERPRET GROUP ERROR SCORES ON RECALL AND ON TRANSFER TEST ITEMS

CONDITIONS	Error rates	Error rates	Error rates
	by types of items:	by types of items:	by types of items:
	RECALL: <u>Low</u>	RECALL: <u>High</u>	RECALL: Low
	TRANSFER: <u>Low</u>	TRANSFER: <u>High</u>	TRANSFER: High
ACTION TO TAKE	The group error rate for all test items is low, and further analysis reveals an even distribution of low error rates for RECALL and for TRANSFER items:  -No diagnostic clues are provided by these results  -It may still be useful to look at individual test items to determine whether there are items on which unusually high error rates occur (as a basis for search for specific sections of the program to account for this result)	An equally high RECALL and TRANSFER rate is not diagnostic of specific types of problems:  -Consider the entire program in need of revision  -Do further analyses:  •Review group results on individual items (See next page)  •Review individual results on multiple items (See next section on page 125)	and TRANSFER rates are high:  -Consider "generalization" as the possible learning failure, AND -Do further analyses:  •Review group results on individual items (See next page)  •Review individual results on multiple items (See next

	+1+1+1\$	e.g.,	e.g.,	e.g.,
ĺ		RECALL Results	RECALL Results	RECALL Results
E	XAMPLES	10% of the student sample made <u>less</u> than 20% errors on <u>recall</u> items	25% of the student sample made <u>more</u> than 20% errors on <u>recall</u> items	5% of the student sample made <u>less</u> than 20% errors on <u>recall</u> items
- [		TRANSFER Results	TRANSFER Results	TRANSFER Results
		15% of the student sample made less than 20% errors on transfer items	40% of the student sample made more than 20% errors on transfer items	35% of the student sample made <u>more</u> than 20% errors on <u>transfer</u> items
		!		
L			L	<u> </u>

## DETERMINING HOW TO INTERPRET GROUP ERROR SCORES ON INDIVIDUAL TEST ITEMS

CONDITIONS	LOW <u>group</u> error rate on individual test items	High group error rate on individual test items
ACTION TO TAKE	-Do not do any further analysis	-Group error rates per se on a single test item are not diagnostic  -When revising the program, review the portion of the program relating to a specific test item for possible deficiencies  -Obtain additional information about the types of wrong answers produced as a means of gaining diagnostic information (See next page)
	<b>.</b>	

EXAMPLES	e.g., -On test item #13, 9% of the student sample made errors	e.g., -On test item #13, 34% of the student sample made errors -Analyze the frequency of particular types of errors made

#### J.2.3 IDENTIFICATION MATRIX

## TYPES OF ERRORS WHICH CAN BE IDENTIFIED WHEN ANALYZING GROUP RESULTS ON INDIVIDUAL ITEMS

TYPE OF ERROR	OMISSION of a <u>correct</u> ACTION	WHICH incorrect ACTION was taken
	-Either on a multiple choice item or on a production item, students may omit an answer  -FORM J.2(1) may be used to indicate how many students omitted an answer for a particular test item  (Time students for test item #1 below)	

# TASK ANALYSIS DIAGRAM Receit to.1 Receit to.1 Transfer fa.fff Receit to.1 ACTION 2.1

Transfer | Ib.lii

Recell Ic.i

FORM J.2(1)

c.	13					
d. -★[[]						
€,						

\*This is correct ACTION (because test item used a "1c" INPUT)

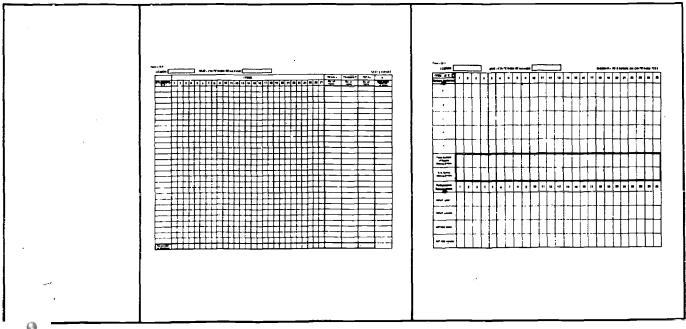

## DETERMINING HOW TO ANALYZE AND INTERPRET GROUP ERROR SCORES ON INDIVIDUAL ITEMS

GOAL	To RECORD GROUP error results for <u>individual</u> test items	To INTERPRET GROUP error results for <u>individual</u> test items
ACTION TO TAKE	-For test items (identified on FORM J.2(2)) on which there are high group error rates, select the test papers (or answer sheets) of all those students who made errors on a particular item  -On FORM J.2(1), code rows a, b, c, d, and e for types of errors: Omission Wrong ACTION: i, ii, iii, iv, etc.  -Record on FORM J.2(1) the frequency with which each type of error is made	-Interpretation based on individual items is undependable  HOWEVER  -Identify which type of error predominates:  •An omission  •Which incorrect ACTION is most frequently taken  -This can form the basis for analyzing program materials to account for this particular type of error pattern (See next page)

FORM J.2(2)

FORM J.2(1)

## DETERMINING HOW TO INTERPRET GROUP RESULTS ON INDIVIDUAL TEST ITEMS

CONDITIONS	OMISSION of response	ROUGHLY EQUAL DISTRIBUTION of types of wrong ACTIONS	UNEQUAL DISTRIBUTIONS  of types of  wrong ACTIONS  (one type of <u>in</u> correct  ACTION predominates)
ACTION TO TAKE	INTERPRET as:  -A failure to acquire relevant ckills (either discriminations, generalizations, or associations)	INTERPRET as:  -An <u>un</u> systematic learning failure (of relevant skills)	INTERPRET as:  -A systematic learning failure (of relevant skills)
	-Which skill is <u>not</u> acquired is indeterminate	-Which skill is <u>not</u> acquired is indeterminate	-One or more of the relevant skills has been learned incorrectly

	The test item involves classifying an example of a lever as a lst, 2nd, or 3rd class lever. The example used is a lst class lever.			
EXAMPLE	e.g., -Of those making errors, approximately 75% omitted making any response -No learning has occurred	e.g., -Of those making errors on this item, 33% omitted answering, 33% endorsed 2nd class, and 33% endorsed 3rd class -The failure is unsustematic	e.g.,  -Of those making errors on this item, 80% endorsed 2nd class lever  -The failure is sustematic	

### NOTE:

As an introduction to procedures to follow in interpreting learner difficulties which result in errors on tests, REVIEW PAGES 73-90 IN SECTION "F" OF THE HANDBOOK.

FOR INDIVIDUAL STUDENTS \*
ON MULTIPLE TEST ITEMS

	page
Three ways multiple test items make interpretation of error patterns possible	128, 129
Forms to use in analyzing error patterns on multiple test items	130, 131
Procedures for filling out, scoring, and analyzing FORMS J.2(1) and J.2(3) for individual students	132, 133
Identifying error patterns	134, 135
FOLDOUT with subject matter examples	
Selecting students whose test scores should be analyzed for error patterns	136
Guidelines for estimating confidence with which interpretations can be made	137
Illustrative error patterns and interpretations	138-147
Recommended procedures for identifying error patterns	148

\* The procedures recommended in this section represent an innovative and, as of March 1973, an unvalidated approach for diagnosing learning failures. Moreover, because the procedures are highly complicated, the reader is advised to: review this section, attempt the associated WORKBOOK exercises, and, should be experience difficulties, shrug them off.

#### J.2.3

## THREE WAYS MULTIPLE TEST ITEMS ASSIST IN DIAGNOSING THE TYPE OF LEARNING FAILURE WHICH HAS RESULTED IN TEST ERRORS

#### MATRIX

ANALYSES MULTIPLE ITEMS ALLOW	Sampling of INPUT classes	2 Assessing the CONSISTENCY of errors	3 Comparison of RECALL and TRANSFER itcms
CRITERIA	Multiple test items permit to be represented in the test:  -Two or more of the INPUT classes which have to be discriminated and/or  -Two or more members belonging to the same INPUT class which require generaliza- tion	Use of multiple test items allows the assessment of the consistency with which errors are made:  -Is the same or a different wrong ACTION taken to two or more INPUTS belonging to the same class?  -Is the same or a different wrong action taken to INPUTS belonging to all the INPUT classes or to same of the INPUT classes?	Use of multiple test items, some RECALL items and some TRANS. ER, permits a comparison of:  -Errors occurring in one but not the other type of test item  -Errors occurring in both types of test items

#### Multiple test items Multiple test items Multiple test items permit the sampling of: permit the assessment permit a comparison of of whether errors are RECALL and TRANSFER -The three classes of **EXAMPLES** consistent or items: INPUTS: (la. lb. and inconsistent: (See illustration 1c): -Is ACTION (2.iii) on opposite page -Is ACTION (2.ii) incorrectly taken: Three test items for notation) incorrectly taken: can provide one ••For just TRANSFER example from each \*\*For just (ia.i), or (la,iii), or class \*\*For (la.ii) and .. For both RECALL (la.i) and TRANSFER -The multiple members (la.iii) as well within each class: (la.iii) -Is ACTION (2.ii) (i, ii, and iii): incorrectly taken: ••Nine test items can ••For just class la), provide one example for each member ••For both class (la) represented in the diagram and (1c)

## IDENTIFICATION MATRIX

# FORMS TO USE IN ANALYZING PATTERNS OF ERRORS ON MULTIPLE ITEMS (ON THIS AND ON OPPOSITE PAGE)

FORMS	FORM J.2(3)	TABLES
CRITERIA	-For each student the types of wrong ACTIONS taken which were identified on FORM J.2(1) are recorded on FORM J.2(3), separately:	-The student's error pattern () is compared with patterns in the tables provided in this section () and the type of learning failure identified
	①··By each INPUT class ②··By each ACTION class taken ③··By RECALL items ④··By TRANSFER items	
	-The types of errors are summarized and categorized (5) -An error pattern is identified	÷ .
	for the student (6)  (See page 133 for procedures)	(See page <u>133</u> for procedures)

Form 1313 ISUR I CRITERION BEHAVIOR FORM J.2(3) CLASSING ACTION TAKEN SHUMARY OF NO OF HEMS 3 CLASS IN PATTERN CLASS CO ACTION TARFO SUMMERS III NO LII TENS 5 CLASSIE MMIT M TRANSFER PATTERN **TABLE** 7 ACTION Omities ACTION ACTIONS ANSWATCHED INPUTS no cums TRAMSTER 1 Generalization 1 Discrimination 2 Association RECALL TRANSFER AO CIPLINTS TRAUSFER 1 Discrimination Generalization THANSFER 2 Association RECALL TRANSFER INPUTS TRAMSFER Discrimination Sennralization TRAMSFER 2 Association SOME Classes RECALL TRANSFER 1 Disceimination Generalization <sup>2</sup> Association RECALL TRANSFER | Olscrimination Generalization TRANSFER TRANSFER some classes <sup>2</sup> Association

RECALL

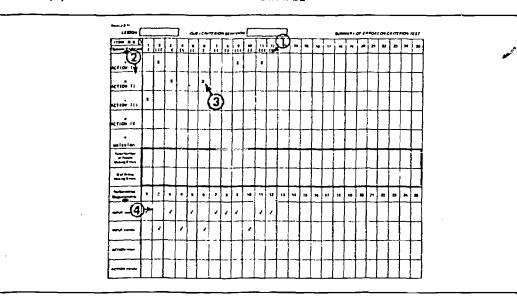

No classes

- Identify the iNPUT class sampled in each test item with a Roman number: Class I, II, III, iv, etc.
- Use rows for ACTION classes corresponding to IMPUT classes (I-IV, etc.), plus a row for omissions
- Record (from original test paper) the wrong ACTION taken (if any) or omission (No entry in a column means that item was correct)
- 4. Identify by checking the appropriate category whether a test item requires INPUT RECALL or INPUT TRANSFER

(Proceed below to procedures for preparing a template for scoring types of errors)

#### FORM J.2(1)

#### EXAMPLE

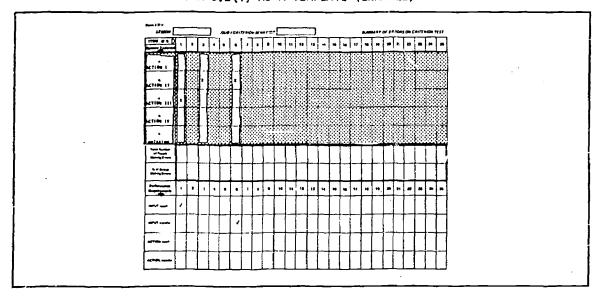

#### PROCEDURES FOR PREPARING A SCORING TEMPLATE

- Create a template for each of the INPUT classes involved in the criterion or subcriterion behavior:
  - The template should expose all the test Items and the possible answers for each class of INPUTS
  - ..In the example below all the answers to items for IMPUT Class I are exposed
  - ..On one item #1 a Class III action was taken; and on #6, a Class II action was taken
- For each INPUT class, add up separately for RECALL items and for TRANSFER items:
  - "The number of correct answers
  - -The number of incorrect ACTIONS taken by type (i.e., i, ii, iii, etc.)
  - -The number of omissions
  - ... In the example below these results are shown:

/For RECALL items (no correct answers, one ill wrong ACTION) one ill wrong ACTION)

/for TRANSFER Items (no correct answers, one II wrong ACTION, no III wrong ACTION)

FORM J.2(1) AS A TEMPLATE (EXAMPLE)

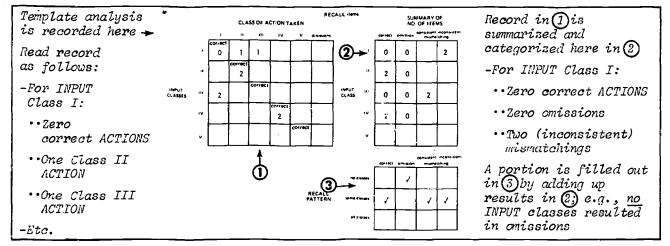

#### PROCEDURES FOR RECORDING TEMPLATE RESULTS ON FORM J.2(3)

- 1. Record the sums obtained from the template analysis on FORM J.2(3):
  - .. For each INPUT class
  - Separately by RECALL and TRANSFER items
- 2. Summarize the results of the analyses for each INPUT class by the following categories:
  - .. Number correct
  - .. Number omitted
  - Number of consistent mismatches of INPUTS and ACTIONS
  - Number of inconsistent mismatches of INPUTS and ACTIONS
- Obtain an error pattern by adding up the number of classes resulting in each category
  - .. SEE NEXT PAGE FOR PROCEDURES

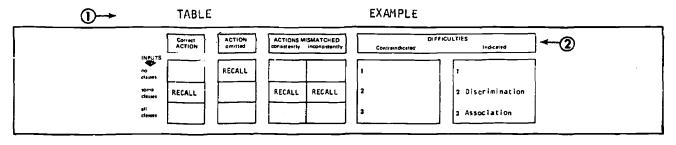

FORM J.2(3)

#### EXAMPLE (RECALL portion only)

#### PROCEDURES FOR COMPARING OBTAINED PATTERN WITH PATTERNS IN TABLES

- Using both the RECALL pattern and the TRANSFER pattern you have obtained (the example above has only RECALL), find a table in this section of the HANDBOOK with which it corresponds.
- If there is a table to match the one you have obtained, read off the diagnosis.
- Repeat all these procedures for all students whose results are to be analyzed in detail.

## DETERMINING HOW TO DEVELOP A RECALL OR TRANSFER PATTERN BASED ON THE SUMMARY OF NUMBER OF ITEMS FALLING INTO EACH CATEGORY (BY CLASS OF INPUTS)

CONDITIONS	ALL items for a given INPUT class fall into ONE cell:  ••All correct, OR  ••All omitted, OR  ••All consistently mismatched, OR  ••All inconsistently mismatched	ltems for a given INPUT class are approximately <u>equally</u> divided across cells	A MAJORITY (or near majority) of items for a given INPUT class fall into ONE cell
ACTION TO TAKE	-Categorize that <u>class</u> in keeping with the 100% endorsement	-Do not categorize that class  -That automatically makes it impossible for the subsequent totaling of the number of classes falling into any category from being "all classes"  -The RECALL pattern or the TRANSFER pattern would, therefore, involve either "no" classes or "some" classes	-Categorize that <u>class</u> in keeping with the <u>majority</u> endorsement  SEE NOTE BELOW

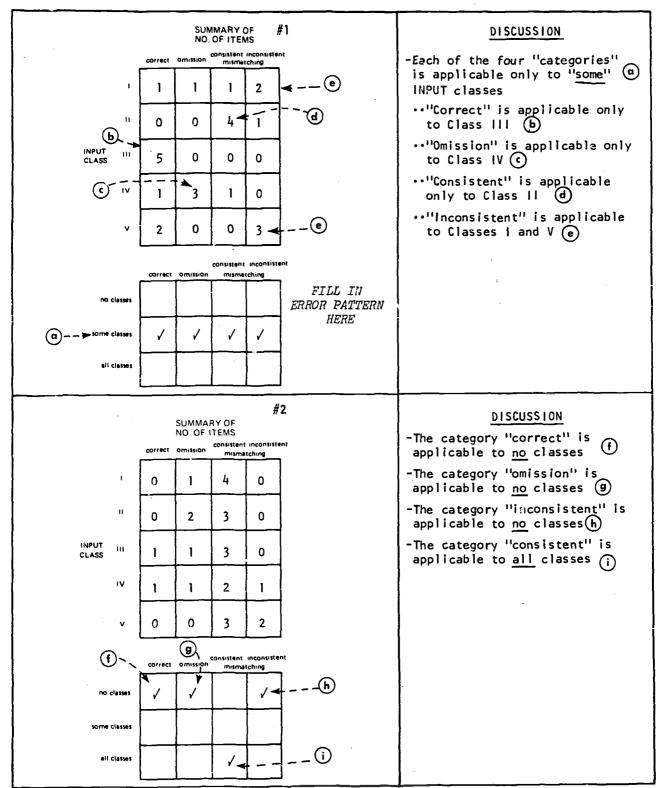

\*The larger the number of items there are covering an INPUT class AND the more of them falling into a given cell, the more dependable the finding and the more dependable the diagnosis based on it.

	SUMMARY OF NO. OF ITEMS	SUMMARY OF NO. OF ITEMS	SUMMARY OF NO. OF ITEMS
INPUT CLASS EXAMPLES		SUMMARY OF NO. OF ITEMS  correct omission consistent inconsistent mismatching  1 1 1 1 1  -INPUT Class #1 would not be categorized	SUMMARY OF NO. OF ITEMS  correct omission consistent inconsistent mismatching  1 2 1  -A near majority of items falls into the "consistent mismatching" category  -Categorize INPUT Class #11 as "consistently mismatched"
		·	

## EXAMPLES ILLUSTRATING HOW TO FILL IN A RECALL OR TRANSFER PATTERN

#### **EXAMPLES**

## J.2.3

## HOW TO SELECT STUDENTS WHOSE PERFORMANCE ON MULTIPLE TEST ITEMS SHOULD BE ANALYZED

## DECISION MATRIX

STUDENT PERFORMANCE ON TOTAL TEST	Students with LOW error rates on TOTAL test: i.e., <u>less</u> than a 20% error rate	Students with HIGH error rates on TOTAL test: i.e., more than a 20% error rate
ACTION TO TAKE	-Do <u>rot</u> include the results of these students in the detailed analysis of error patterns	-Consider the results of these students for inclusion in the detailed analysis of error patterns
		-Select from among these students those with error rates in the range of 30%-60% (if available)
·		-Exclude students with error rates of 70% or higher
		-Select a sample of approximately ten to twenty students for this analysis

RATIONALE	Low frequency of errors makes it difficult to detect <u>patterns</u> of errors	-A small sample of students is recommended (i.e., n = 10-20) because this type of analysis is time consuming -Error rates in excess of 60%-70% are probably indicative of no learning having occurred rather than of specific failures to be diagnosed

## VARIABLES TO CONSIDER IN ESTIMATING THE CONFIDENCE WITH WHICH INTERPRETATIONS CAN BE MADE

WATRIA		
CONDITIONS	-The more test items there are reflecting the same error pattern AND -The more students there are exhibiting the same error pattern	-The fewer test items there are reflecting the same error pattern AND -The fewer students there are exhibiting the same error pattern
ACTION TO TAKE	INTERPRET  The more test items there are reflecting the same error pattern, the lower the probability that the results were obtained by chance  In combination with the above finding, the higher the percentage of students exhibiting the same error pattern, the more dependable the interpretation  The key variable, however, is the number of test items	the higher the probability that the results were obtained by chance -In combination with the above finding, the lower the percentage of students exhibiting the same

## EXAMPLES

- -There are twelve test items, each item having a different example of a lever (four examples for each of the three classes of levers)
- -All four items from one of the classes are given the same wrong classification
- -The probability of this occurring by chance is relatively <u>low</u>
- -Interpretation is easier to make

- -There are three test items, each item having a different example of a lever (one example for each of the three classes of levers)
- -One item from a class is given a wrong classification
- -The probability of this occurring by chance is relatively high
- -Interpretation is harder to make

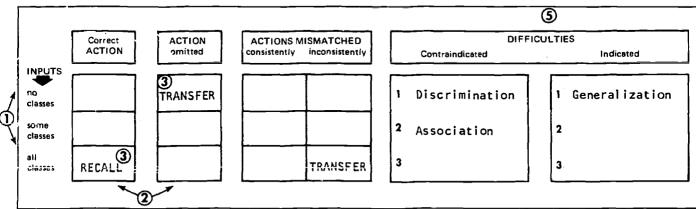

Each of the numbered statements below refers to a comparably numbered section of the illustrative diagnostic table below or to the task analysis table on the opposite page.

- 1. Rows in the table indicate how many classes were treated in particular ways by the student: all the INPUT classes, some of them, or all of them. For the example on the opposite page, that means, how were each of the three classes treated by the student. All means that three classes were treated in a particular way; some means that one or two were treated in a particular way; and no means that none of the classes were treated in a particular way.
- 2. Columns identify the ways in which INPUT classes were treated:
  - ··Correct ACTIONS could have been taken
  - ··ACTIONS could have been omitted
  - .. INPUTS and ACTIONS could have been mismatched:

/Consistently (i.e., multiple items from the same INPUT class led to the same wrong ACTION, belonging to another class)

- /inconsistently (i.e., multiple items from the same INPUT class led to varied wrong ACTIONS)
- The different pattern applying to RECALL items and to TRANSFER items are indicated by entried labeled RECALL or TRANSFER
- 4. Multiple entries for either RECALL or for TRANSFER items are possible indicating that classes can be treated in a variety of ways (correct, incorrect, and with omission)
- 5. Diagnoses appear in the last two columns.

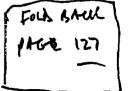

#### ILLUSTRATIVE DIAGNOSTIC TABLE\*

\*The illustrative table should be read as follows: on RECALL items all INPUT classes were treated correctly (i.e., the correct ACTIONS were produced); on TRANSFER items:

no INPUT classes resulted in omission of an answer, and all INPUT classes resulted in inconsistent mismatching of INPUTS and ACTIONS.

INTERPRETATION: The most likely difficulty indicated is "generalization." In descending order of probability, the difficulties contraindicated are "discrimination" and "association."

#### **TABLES**

The next several pages present diagnostic tables interpreting error patterns which are more easily interpreted than other possible patterns. Whenever the patterns you encounter in your work are not illustrated here and it is unclear what learning difficulties produced test errors, you may have to resort to the administration of diagnostic tests and interview probes (See Sub-STEP J.2.4).

FOLD OUT THIS PAGE FOR SUBJECT MATTER EXAMPLES WHICH WILL BE USED TO ILLUSTRATE ERROR PATTERNS

CRITERION BEHAVIOR:

To classify examples of levers belonging to each of

the three classes of levers.

CRITERION TEST:

Twelve test items comprise the criterion test:

·· Four items apiece test for each class of levers

(INPUTS)

.. Of the four items for each class:

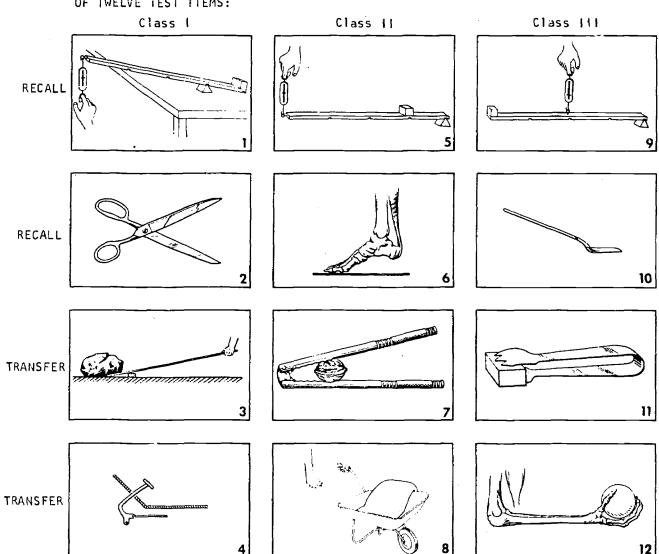

/Two are RECALL items (containing examples used

in instruction)

/Two are TRANSFER items (containing examples not

used in instruction)

## EXAMPLES USED IN EACH OF TWELVE TEST ITEMS:

SOME DIAGNOSTIC TABLES

DIFFICULTIES ACTION **ACTIONS MISMATCHED** Correct ACTION omitted consistently inconsistently Indicated Contraindicated INPUTS Systematic RECALL RECALL no association Discrimination **TRANSFER** TRANSFER classes 2 Generalization some classes RECALL all 3 3 classes TRANSFER \*Recall and transfer items are mismatched in the same way. INPUTS RECALL RECALL no TRANSFER **TRANSFER** classes 2 Discrimination 2 some classes **RECALL** all 3 Generalization 3 Association TRANSFER classes \*\*Recall and transfer items are mismatched in different ways. INPUTS 1 no classes RECALL RECALL RECALL 2 some **TRANSFER** TRANSFER TRANSFER classes 3 Discriminations all 3 classes INPUTS no classes some classes 3 classes IN<u>PU</u>TS no classes 2 some 2 classes all 3 classes INPUTS no classes some 2 2 classes all 3 classes

### EXAMPLES

	<del></del>	<del></del>
	RESULTS	INTERPRETATION
PATTERN #1	a. All classes of levers have been mismatched, for both RECALL and TRANSFER items	b. (1) Since each of the quartets of items represents a different class and all
	b. The mismatching was consistent:  (1) Each of the classes of levers (1, 11, 111) led to a different (wrong) ACTION (labeling)  PLUS  (2) Each of the examples within a class led to the same (wrong) ACTION (labeling):  1, 2, 3, 4 were classified as 111  5, 6, 7, 8 were classified as 1  9, 10, 11, 12 were	b. (2) Since members of each quartet represent the same
	classified as !l	
PATTERN #2	a. All classes of levers have been mismatched, for both RECALL and TRANSFER items	b. (1) Classes which should have been treated differently were treated alike
	b. The mismatching was inconsistent:  (1) Some of the classes were treated the same way other classes were:  ••I and II were treated the same way; OR  ••I and III were treated the same way; OR  ••II and III were treated the same way  (2) SOME of the examples within a class were treated with a different (wrong) response:  ••I and 3 were classified	(2) Examples within classes which should have been treated alike were treated differently  b. The problem is probably one of discrimination and generalization
	••2 and 4 were classified	
PATTERN #3	a. Some classes were treated correctly; some incorrectly	b. Problem may be that of discrimination
	b. Incorrect treatment was consistent for some classes and inconsistent for others	

<sup>\*</sup>Numbers used in the example refer to the test items on foldout page  $\underline{140}$ 

DIFFICULTIES Correct **ACTION ACTIONS MISMATCHED ACTION** omitted consistently inconsistently Indicated Contraindicated INPUTS TRANSFER no 1 Discrimination 1 Generalization classes 2 Association some 2 classes all TRANSFER RECALL 3 3 classes INPUTS TRANSFER 1 Discrimination Generalization no classes 2 Association TRANSFER some 2 classes all 3 **TRANSFER** 3 RECALL classes INPUTS TRANSFER 1 Discrimination Generalization no classes 2 Association TRANSFER some classes **TRANSFER** all RECALL 3 3 classes INPUTS 1 Discrimination Generalization no classes 7 some 2 Association classes ali **TRANSFER** RECALL classes INPUTS Generalization no 1 Discrimination classes TRANSFER 2 TRANSFER some 2 Association classes all RECALL classes INPUTS no classes some 2 classes all classes

J.2.3

#### EXAMPLES ILLUSTRATING PATTERNS ON OPPOSITE PAGE\*

#### **EXAMPLES**

#### PATTERN #4

### RESULTS

- on RECALL items, all classes and members within classes have been correctly treated
- b. Mismatching of INPUTS and ACTIONS occurs for TRANSFER items only
  - b.1 Consistent
  - b.2 Inconsistent
- c. In some cases TRANSFER items are correct (for some classes) or are omitted (for some classes)

#### INTERPRETATION

- a. Since all RECALL items are correct, correct discriminations and associations have occurred
- b. Only TRANSFER items are incorrect--suggesting that generalization to unencountered examples has failed

### J.2.3 DECISION MATRIX

### DETERMINING HOW TO USE RAW DATA OF PATTERN ANALYSIS TO GAIN FURTHER DIAGNOSTIC INFORMATION

TYPE OF	Data in matrix	Data in matrix
INFORMATION	on FORM J.2(3)	on FORM J.2(3)
AVAILABLE	regarding INPUT classes	regarding ACTION classes
ACTION TO TAKE	For each student in the diagnostic sample:  -Observe for each INPUT class where the errors pile up; i.e., in ACTION Class I, II, III, IV, or V, or in an omission  -Observe whether for other INPUT classes the pile up is:  ••The same ••Different  -Use this as raw data for identifying the confusions which exist  COMPARE THE RESULTS WITH THOSE OF OTHER STUDENTS IN THE DIAGNOSTIC SAMPLE	For each student in the diagnostic sample:  -Observe for each ACTION class where the errors pile up; i.e., in INPUT Class I, II, III, IV, or V, or in an amission  -Observe whether for other ACTION classes the pile up is:  • The same • Different

# J.2.3 IDENTIFICATION MATRIX

#### TWO VARIABLES USEFUL FOR IDENTIFYING DIFFICULTIES

VARIABLES	EVENNESS of distribution of errors ••For INPUTS (across ACTIONS) ••For ACTIONS (across INPUTS)	DEGREE OF OVERLAP across classes
CRITERIA	-For each INPUT class is there:  . An even distribution across wrong ACTIONS  OR  . An uneven distribution (i.e., pile up) across wrong ACTIONS  -For each ACTION is there:  . An even distribution across INPUT classes  . An uneven distribution across INPUT classes	-For two or more classes of INPUTS is there:  ··Overlap in the type of distribution across ACTIONS  ··Non-overlap in the type of distribution across ACTIONS  -For two or more ACTIONS is there:  ··Overlap in the type of distribution across INPUT classes  ··Non-overlap in the type of distribution across INPUT classes

#### INTERPRETATION

### For INPUTS:

- -Uneven distribution for an INPUT class means that there is a systematic error for that class;
- -Even distributions for an INPUT class means non-systematic errors for that class

#### For ACTIONS:

- -Uneven distribution for an ACTION means a systematic error
- -Even distributions for an ACTION means a non-systematic error

- -The more overlap in an even distribution of errors there is, the more likely is there a failure to discriminate among classes
- -The less overlap there is in an uneven distribution, the more likely is the failure to be one of association

J.2.3

### USE OF "DELAYED" TESTING

page
152
153

## J.2.3 IDENTIFICATION MATRIX

### DIFFERENT PURPOSES IN DEVELOPMENTAL TESTING FOR PROFICIENCY AT DIFFERENT TIMES

TIME OF TESTING	Testing IMMEDIATELY AFTER students complete program	Testing ON A DELAYED BASIS after students complete program
CRITERIA	-Purpose is to determine whether:  ••Students have acquired sub-criterion and criterion behaviors  ••What types of failures have occurred (which skills are not adequately learned)	-Purpose is to determine whether:  ••Students have retained what they had already acquired from the program ••Which specific skills are forgotten

J.2.3
DECISION
MATRIX

### DETERMINING IN WHICH PART OF DEVELOPMENTAL CYCLE TO ADMINISTER TESTS ON AN IMMEDIATE AND DELAYED BASIS

TYPE OF TESTING	IMMEDIATE	DELAYED
ACTION TO TAKE	-Administer an "immediate"  after test on:  ••Each and every cycle of developmental tryout; i.e., if, for example, there are three cycles of tryout, "immediate" tests would be administered on all three occasions	-Administer a "delayed"  after test on:  ··Later stages of the development tryout cycle; i.e., if, for example, there are three cycles of tryout, "delayed" tests would be administered only after the third cycle  OR  ··Administer the delayed test after a tryout in which high
*		proficiency has been demonstrated and consequently little revision made on the program

RATIONALE	It is important to determine whether students were able to acquire what they were supposed to learn	If students did not in the first place acquire criterion behaviors, delayed testing would not be diagnostic of retention problems (since no retention could be expected to occur)
		***
<b>9</b>		

### ASSESSING "SEQUENCING" DECISIONS

	page
Differences between <u>sequencing</u> decisions made in Task C and in Task G	156
Two methods for assessing sequencing decisions regarding separate criterion behaviors	157
Two methods for assessing sequencing decisions regarding components within a single criterion behavior	158

\*SECTION "J" up to this point has been concerned with assessing student proficiency at a <u>single</u> criterion behavior (and at the sub-criterion behaviors which make it up). The next several pages are concerned with assessing proficiency at two or more criterion behaviors as a means of determining the adequacy of sequencing decisions made in TASK "C."

# J.2.3 IDENTIFICATION MATRIX

### DIFFERENCES BETWEEN SEQUENCING DECISIONS MADE IN TASK "C" AND IN TASK "G"

TASKS	Sequencing decisions . in TASK "C"	Sequencing decisions in TASK "G"
CRITERIA	-The decision is made as to the order in which a number of different criterion behaviors should be learned  -The purpose of the decision is to sequence learning experiences so that prior mastery of criterion behaviors which can facilitate the learning of other criterion behaviors are taught earlier in the overall program	-The decision is made as to the order in which components of a single criterion behavior should be learned  -Components ordered in various ways include:  • Sub-criterion behaviors  • Individual skills which make up the sub-criterion behaviors  -The purpose is to order or sequence the learning of components so that mastery of the total criterion behavior will be most efficient

EXAMPLES	e.g., -Two criterion behaviors involve the following two concepts:  •·Force  •·Pressure -The decision has to be made in Task "C": In what order should the two concepts be taught so that learning can be optimized	e.g., -For teaching the concept "force" what is the optimum order for teaching the relevant:  • Discriminations  • Generalizations  • Associations  involved in the concept
----------	---	---

# TWO POSSIBLE METHODS FOR ASSESSING THE ADEQUACY OF SEQUENCING DECISIONS MADE IN TASK "C" (REGARDING SEPARATE CRITERION BEHAVIORS)

METHODS	EXPERIMENTAL *	STATISTICAL*
CRITERIA	-During developmental tryout (preferably late in the tryout and revision cycle when the instructional program for each criterion behavior results in relatively high proficiency) the programs for two or more separate criterion behaviors can be administered to different groups of tryout students in different orders:  Group 1 learns criterion behavior A first and B second Group 2 learns criterion behavior B first and A second -The groups are then compared for differences in:  Time to complete the instructional program related to each criterion behavior Number of errors in the instructional program Scores on proficiency tests (difference between "before" and "after" scores)  -If A should precede B, as originally decided, there should be substantial and significant differences between the two groups	-During developmental tryout (preferably early in the tryout and revision cycle when there are still relatively wide differences among students in performance on criterion tests or on programs) groups may be camposed on one of the following bases:  ·Number of errors on program for criterion behavior A  ·Time to complete program for criterion behavior A  ·Proficiency scores on test for criterion behavior A  -Two groups are formed:  ·A high scoring group  on the variable selected above  -Their scores for criterion behavior B are then compared on the same variable or on other variables  -(An alternative to group comparison is to compute a correlation between scores on A and on B)  -If A should, in fact, precede B, high achievers on A should be relatively lower achievers on B; and low achievers on A should be
		· · · · · · · · · · · · · · · · · · ·
EXAMPLES	e.g.,  -Group 1 would take the program on  •·Force first, and  •·Pressure second  -Group 2 would take the program on  •·Pressure first, and  •·Isace second	e.g.,  :-High achievers on the "force" test and low achievers on the "force" test should be compared for achievement on the "pressure" test ("force" having been taught to all before "pressure")  -Controlling for ability: If "force" should precede "pressure," the highs on "force" should be the highs on "pressure"
	· ·	1

## J.2.3 IDENTIFICATION MATRIX

## TWO POSSIBLE METHODS FOR ASSESSING THE ADEQUACY OF SEQUENCING DECISIONS MADE IN TASK "G" (REGARDING COMPONENTS OF A SINGLE CRITERION BEHAVIOR).

-During developmental tryout (preferably late in the tryout and revision cycle when the instructional program for each criterion behavior results in relatively high proficiency the programs for two or more separate sub-ariterion behaviors related to the same criterion behavior can be administered to different groups of tryout students in different orders:  'Group 1 learns sub-oriterion behavior A first and B second 'Group 2 learns sub-oriterion behavior B first and A second  'The groups are then compared for differences in:  'Time to complete the instructional program 'Scores on proficiency tests (difference between "hefore" and "after" scores)  -If A should precede B, as originally decided, there should be substantial and significant differences between the two groups groups  **A can be provided be relatively larger achievers on B  **Can be administed to differences on test for sub-criterion behavior A 'Proficiency acores on test for sub-criterion		<del></del>	
(preferably late in the tryout and revision ayale when the instructional program for each criterion behavior results in relatively high proficiency) the programs for two or more separate sub-criterion behaviors related to the same criterion behavior can be administered to different groups of tryout students in different orders:  "CRITERIA"  CRITERIA CRITERIA  CRIT	METHODS	EXPER IMENTAL	STATISTICAL
	CRITERIA	(preferably late in the tryout and revision cycle when the instructional program for each criterion behavior results in relatively high proficiency) the programs for two or more separate sub-criterion behaviors related to the same criterion behavior can be administered to different groups of tryout students in different orders:  • Group 1 learns sub-criterion behavior A first and B second  • Group 2 learns sub-criterion behavior B first and A second  - The groups are then compared for differences in:  • Time to complete the instructional program related to each sub-criterion behavior  • Number of errors in the instructional program  • Scores on proficiency tests (difference between "before" and "after" scores)  - If A should precede B, as originally decided, there should be substantial and significant differences between the two	(preferably early in the tryout and revision cycle when there are still relatively wide differences among students in performance on sub-criterion tests or on programs) groups may be composed on one of the following bases:  · Mumber of errors on program for sub-criterion behavior A  · Time to complete program for sub-criterion behavior A  · Proficiency scores on test for sub-criterion behavior A  - Two groups are formed:  · A high scoring group  on the variable selected above  - Their scores for criterion behavior B are then compared on the same variable or on other variables  - (An alternative to group comparison is to compute a correlation between scores on A and on B)  - If A should, in fact, precede B, high achievers on A should be relatively higher achievers on B; and low achievers on A should be
		<del></del>	

### EXAMPLES

#### e.g.,

The criterion behavior involves the concept force; <u>sub-criterion</u> behaviors involve "direction of force" and "strength of force"

-Groups 1 and 2 would differ in the order in which they took that part of the program on "direction" and "strength" of a force

#### e.g.,

- -High and low achievers regarding "direction" (taught first) would be compared for performance regarding "strength" (taught second)
- -Controlling for ability: There should be a difference between highs and lows on "strength" if the sequence is facilitative

J.2.3 DECISION MATRIX

## PRIORITIES IN THE ANALYSIS OF TEST RESULTS AS A MEANS OF IDENTIFYING TYPES OF LEARNING FAILURES WHICH HAVE OCCURRED

PRIORITIES	lst Analysis of GROUP results	2nd Analysis of results of INDIVIDUAL students	3rd Use of special DIAGNOSTIC TESTS and INTERVIEWS See Sub-STEP J.2.4)
ACTION TO TAKE	-ALWAYS start with GROUP results first -Analyse GROUP results in the following order:  (1) Total test scores  ··Low error scores, do NOT continue  ··Relatively high error scores, continue  (2) Test scores summed for all RECALL items and swimed for all TRANSFER items  (3) GROUP error score for individual test items	existence of major and extension problems and which are not readily diagnosed by group results	

RATIONALE	-These types of analyses are easiest and least time- consuming to do  -They can provide information that:  • There are no major learning problems (in which case no further analysis is needed)  • There are major problems (in which case further analysis is indicated - See next column)	This is a time- consuming procedure and is therefore only undertaken when the GROUP approach provides insufficient evidence as to the types of learning failure which have occurred	This, too, is a time- consuming procedure and is therefore undertaken when both the GROUP and iNDIVIDUAL approaches provide insufficient evidence as to the types of learning failure which have occurred
-----------	---	---	---

# J.2.3 IDENTIFICATION MATRIX

### IDENTIFYING CONDITIONS WHEN IT IS NECESSARY TO ASSESS FOR DELAYED RETENTION AND FOR SEQUENCING ADEQUACY

TYPE OF ASSESSMENT	Assessing DELAYED RETENTION	Assessing effects of SEQUENCING DECISIONS
CRITERIA	CONDITIONS  -When statement of objectives calls for performance on a delayed basis, administer criterion tests to a tryout samplelate in the developmental cycle (when the program has already undergone one or two cycles of revision and has resulted in immediate (non-delayed) high proficiency)	CONDITIONS  -It is always useful to assess the adequacy of sequencing decisions made both with respect to:  ••Separate criterion behaviors  ••Components within a single criterion behavior

### ILLUSTRATION SUMMARIZING PROCEDURES INVOLVED IN ADMINISTERING, SCORING, AND INTERPRETING RESULTS ON TESTS

#1

- a. Administer criterion and sub-criterion tests to tryout sample of approximately 25-50 students immediately after their completion of the program
- b. Score tests and record on FORM J.2(2)
- c. Compute for the GROUP:
  - ·· Total error scores
  - •• RECALL and TRANSFER scores
  - ..Error scores on individual items
- d. Select high error students on specific test items and analyze their errors on FORM J.2(1):
  - · · Omissions
  - Specific wrong ACTIONS taken

#2

- -If further analysis is needed to identify types of learning failures:
- a. For a sub-sample of approximately ten high error students, fill out FORM J.2(1)
- b. Make up a template
  to score for error
  patterns on
  multiple test
  items which
  individual
  students exhibit
- c. Identify the pattern and interpret it from tables in this section of the HANDBOOK
- \*Fill out a separate form for each student

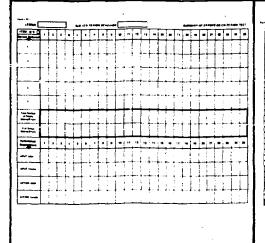

#3

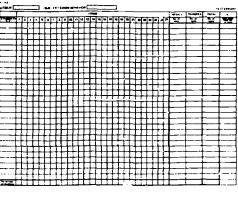

- a. Administer tests
  on a <u>delayed</u> basis
  to students in
  later cycles of
  development
  tryout; assess
  retention
- b. Assess sequencing decisions:
  - ·· Experimentally
  - ••Statistically
    for two types of
  - probes:
    ••Order of two or
  - more criterion behaviors
  - \*\*Order of components of a single criterion behavior

## J.2.4 IDENTIFICATION MATRIX

### INFORMATION SOURCES TO REVIEW AND TYPES OF INFORMATION TO SEEK

INFORMATION	FORM J.2(2) - TEST RESULTS	DIAGNOSES
SOURCES	and	made from FORM J.2(3)
TO REVIEW	PERFORMANCE on PROGRAM	and from FORM J.2(2)
CRITERIA	-Proficiency on criterion tests and on sub-criterion tests:  · Percentage of students exceeding a predetermined error rate on tests*  -Error rates on program problems: · Criterion program problems · Sub-criterion program problems  /Percentage of students exceeding a predetermined percentage*	-Difference in RECALL/TRANSFER problems identified on FORM J.2(2) -Specific learning failures diagnosed from patterns of errors of individual students on multiple test items

 $\star A$  20 percent error rate cutoff point is recommended.

J.2.4 DECISION MATRIX

### DETERMINING WHEN TO ADMINISTER DIAGNOSTIC TESTS AND TO PROBE FOR ERROR SOURCES DURING INTERVIEWS

CONDITIONS	-On tests <u>and</u> on programs a <u>high</u> percentage of students (80% or more) exceeding a 20% error rate AND -DEPENDABLE diagnoses obtained from analysis of GROUP and INDIVIDUAL results	-On tests <u>and</u> on programs a <u>high</u> percentage of students (80% or more) exceeding a 20% error rate AND -Diagnoses based our GROUP and INDIVIDUAL results are NOT sufficiently dependable or clear	-On tests <u>and</u> on programs a <u>high</u> percentage of students (80% or more) makes <u>fewer</u> than 20% errors
ACTION TO TAKE	-Do <u>NOT</u> do further diagnostic work	-Administer diagnostic tests developed in TASK "F" (developing additional tests at this time if needed) -Conduct interviews with "high error" students:  ••Re: test errors  ••Re: program errors	-Do NOT do any diagnostic work

J.2.4

### ILLUSTRATION SUMMARIZING PROCEDURES FOR DETERMINING WHETHER TO AND FOR DOING FURTHER DIAGNOSTIC WORK

#1

### REVIEW

- a. OUTPUT of Sub-STEP J.2.3 for error rates on program
- b. OUTPUT of Sub-STEP J.2.3 for error rates on tests

#2

### IDENTIFY

- a. Error rates on program and on tests
- Percentage of students exceeding a predetermined standard
- c. Availability of unambiguous and dependable diagnostic information already available

#3

### ADMINISTER

- a. Diagnostic tests
- b. Interviews probing for types of learning failure on:
  - · · Tests
  - · · Programs

when information identified in #2 is inadequate

### J.2.4 STANDARDS MATRIX

### ASSESSING THE ADEQUACY OF PROCEDURES FOR DIAGNOSING SOURCES OF ERRORS

PROPERTIES	EFFICIENCY	COMPLETENESS
CRITERIA	-Diagnostic tests and interviews are used only when:  • There are high error rates on program and on tests  AND  • It is unclear from analyses of these errors what the sources of errors are	-Sources of errors (i.e., whether there was a discrimination, generalization, association, or chaining failure) for:  **Each sub-criterion behavior covered by the program  AND  **The criterion behavior covered by the program

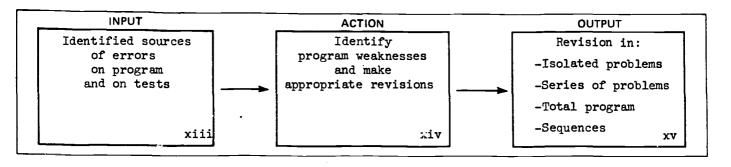

### PREVIEW OF THE NEXT SubSTEP

INFORMATION SOURCES	INFORMATION OBTAINED	TYPES OF LEARNING FAILURES IDENTIFIED	PROGRAM VEAKNESSES 15ENTIFIED	REVISIONS TO BE MADE IN PROGRAM
-Test scores (ERRORS)  ••Sub-criterion scores and criterion scores, subtest scores, individual item scores, and frequency of endor-ements of particular answers  ••Scores for groups and for individuals  ••Criterion problems, sub-criterion problems, individual problems, and specific answers exhibited  -Special diagnostic procedures  ••Diagnostic tests ••Interviews	-Proficiency levels "Before" and "after" instruction On criterion and sub-criterion behaviors On differential types of behaviors //RECALL/TKANSFER /Component skills (discriminations, generalizations, associations, and chains) /Immediate and delayed retention /Spicific information On other inter- related criterion behaviors: /Taught elsewhere in the same program /Taught in other programs -Diagnostic information  .frequency of specific errors  .Student errors in attention to features of the programSpecific types of learning failures	-Types of failures No lcarning Incorrect learning -Acquisition failures Discriminations Generalizations Generalizations Associations Chains  -Sources of failures Properties of	-Types of practice proyided by the programOmissions of relevant practice relevant of practice confusing, or misleading practicePoorly sequenced practice	-Changes in type of practice provided -·Inclusion of practice omitted -·Increase in the amount of practice -·Revision of program sections program sections program sections devoted to different criterion behaviors

# J.2.5 IDENTIFICATION MATRIX

### TWO SOURCES FOR IDENTIFYING PROGRAM WEAKNESSES

SOURCES	DIRECT EVIDENCE	I NFERENCE*
CRITERIA	-Student reports in diagnostic interviews directly identify:  ··Vocabulary sentence difficulties  ··Pifficulties understanding instructions or a statement of objectives  ··Examples of problem features that caused them difficulties  -Alternating program sequences produce differential performance results  -Errors on specific program problems:  ··Individual problems  ··A series of problems	-Student behavior on tasks:  • Does something counter to instructions provided  • Fails to do what instructions require  -Results on tests:  • Number of errors  • Types of wrong answers  • Patterns of errors  • Errors on problems linked to specific component skills

\*The burden of identifying roogram weakness usually lies most on  $\underline{\text{inference}}$  from program and test results.

EXAMPLES	e.g., student reports of difficulties with specific features of a program provide direct evidence of program weaknesses	e.g., a specific wrong answer produced by a large percentage of the tryout sample suggests the possibility of the program having produced the misconception
	e.g., if a comparison of results for program sections administered in different orders produces differential results, this is direct evidence of what the optimum sequence is (and conversely what is a poor sequence)	instructional sequence

## J.2.5 IDENTIFICATION MATRIX

### FOUR POSSIBLE AMOUNTS OF PROGRAM REVISION (On this and on opposite page)

POSSIBLE AMOUNTS	Changes in ISOLATED	Changes in a SEQUENTIAL SERIES of
PROGRAM CHANGE	(individual) problems throughout the instructional program	(several) problems in the instructional program
CRITERIA	-Changes are made in individual program problems (or individual program tasks) -Changes made on each problem are unrelated to changes made in other program problems	-Changes are made in a number of serially ordered program problems (but the number is less than that involved in the whole program)  -Changes made in each problem are related to the changes made in other problems in the series (because performance on one problem affects performance on the next, etc.)

#### e.g.,

On a program involving 125 practice problems dealing with a criterion behavior, changes may be made in:

-The following <u>isolated</u> problems: ...12, 29, 47, 89, 103, 116, etc.

- -The following series of problems:
  - ..12, 13, 14, 15, 16, and 17
  - ..103, 104, 105, 106, 107, 108, and 109

### e.g.,

On a program involving practice of 18 steps involved in a procedural task, changes may be made in practice involving:

-Steps 5, 26, 32, 68, etc.

-Steps 5, 6, 7, 8, and 9

## FOUR POSSIBLE AMOUNTS OF PROGRAM REVISION (On this and on opposite page)

MAINIA		<del></del>
POSSIBLE AMOUNTS OF PROGRAM CHANGE	3 Changes in the ENT!RE PROGRAM related to ••A sub-criterion behavior ••A criterion behavior	Changes in the SEQUENCE of programs  ••For separate sub-criterion behaviors (re: the same criterion behavior)  ••For different criterion behaviors
CRITERIA	-Changes are made in the entire instructional program (but not necessarily on every problem or on every part of a practice task) related to one or both of the following:  ••A sub-criterion behavior  ••A criterion behavior  -Changes made are interrelated to one another	-Only the sequence with which intact programs (or intact parts of programs) are administered is altered

EXAMPLES	e.g.,  On a program involving 125 practice problems dealing with a criterion behavior, changes may be made in:  -The entire series of program problems from 1-125 (although not necessarily in all problems)  e.g.,  On a program involving practice of 78 steps involved in a procedural task, changes may be made in practice involving:  -Practice for the entire series of steps (1-78) may be changed	e.g.,  -The sequence in which separate programs for criterion behavior R and criterion behavior B are administered may be reversed  e.g.,  -The sequence in which program sections (within the same overall program) for sub-criterion behaviors A and B (both related to the same criterion behavior) may be reversed
	steps (1-78) may be changed	

## IDENTIFYING CONDITIONS CALLING FOR VARYING DEGREES OF PROGRAM REVISION (On this and on opposite page)

	<del></del>	
AMOUNT OF PROGRAM REVISION	l CONDITIONS calling for: Changes in ISOLATED (individual) problems throughout the instructional program	2  CONDITIONS calling for:  Changes in a SEQUENTIAL SERIES of (several) problems in the instructional program
CRITERIA	ERROR RESULTS  -% of people: less than 20%  Error rate: more than 20%  • On the total instructional program  and:  • On the sub-criterion and criterion tests covering the program  AND  -% of people: more than 20%  Error rate: more than 30%  • On individual, isolated program	ERROR RESULTS  -% of people: less than 20%  -Error rate: more than 20%  •On the total instructional program  and  •On the sub-criterion and criterion tests covering the program  AND  -% of people: more than 20%  Error rate: more than 20%  •On a sequential series of
·	problems or program tasks	program problems or tasks . and/or . On test items testing for material covered by the series of problems

	e.g., RESULTS		e.g., RESULTS	
EXAMPLES Program:	-Total progra	m: 11% of sample makes more than 20% errors	-Total prog	ram: 9% of sample makes more than 20% errors
••Has 100 problems Test:	-Total test:	16% of sample makes more tran 20% errors AND	-Total test	: 12% of sample makes more than 20% errors AND
··Has 25 items			-Оп рходчат	
	{			AND
				22% of the sample makes errors on all test items related to content covered in program problem #'s 6-13

## IDENTIFICATION MATRIX

## IDENTIFYING CONDITIONS CALLING FOR VARYING DEGREES OF PROGRAM REVISION (On this and on opposite page)

POSSIBLE AMOUNTS OF PROGRAM CHANGE	3  CONDITIONS calling for:  Changes in the ENTIRE PROGRAM related to  A sub-criterion behavior  A criterion behavior	CONDITIONS calling for:  Changes in the SEQUENCE of programs  For separate sub-criterion behaviors (re: the same criterion behavior)  For different criterion behaviors
	ERROR RESULTS  -% of people: More than 20%  -Error rate: More than 20%  ••On total instructional program and/or  ••On criterion and/or sub-criterion tests	EXPERIMENTAL  assessment of sequence suitability  -Sequence A-B yields a lower error rate:  .On Program A and on Program B and  .On tests for A and for B than the sequence B-A  STATISTICAL assessment of sequence suitability  -Test results* for programs A and B:  .Low error scores on A tend to be low error scores on B  . High error scores on B

EXAMPLES	e.g., RESULTS  -In the sequence A-B, the average	<ul><li>2.g., RESULTS</li><li>In the sequence A-B, the average</li></ul>
Program:  ••Has 100 problems	error rate on tests for A and B was 38% -In the sequence B-A, the average error rate on tests for A and B	error rate on tests for A and B was 18% -In the sequence B-A, the average error rate on tests for A and B
Test: ••Has 25 items	was 29%	was 1%

\*Test results used in this way can be for programs under development or for existing programs which are thought to produce prerequisite entering behaviors.

## DETERMINING HOW MUCH OF THE INSTRUCTIONAL PROGRAM TO REVISE

CONDITIONS	Error rates:  on TESTS and/or on PROGRAM are:  ··Low (less than 20%)  ··For most of the tryout sample (more than 80%)	Error rates:  c.i TESTS and/or on PROGRAM are:  ••High (more than 20%)  ••For a large part of the tryout sample (more than 20%)	Error rates:  on TESTS and/or on PROGRAM are:  ••Substantially different for alternative sequences (whether overall error rates are high or low)
ACTION TO TAKE	-No not plan extensive program revision  -Identify individual program problems or series of program problems on which high error rates have occurred; revise these program problems	-Plan a revision of the entire program  -Make revisions:  •In those individual practice problems or  •In the series of practice problems on which results indicate:  •Migh error rates and/or  •High error rates on test problems related to program problems	-Alter the sequence of practice:  • Practice related to two or more sub-criterion hehaviors related to the same criterion behavior  OR  • Practice related to two or more different criterion behaviors  -Make changes in the programs themselves according to the adjacent columns

## REVISING INDIVIDUAL PRACTICE PROBLEMS

	page
Sources of information about weaknesses of individual practice problems	184
Types of weaknesses in individual practice problems	185
Revisions to make in individual practice problems to eliminate weaknesses	186, 187

## SOURCES OF INFORMATION ABOUT WEAKNESSES OF INDIVIDUAL (ISOLATED) PRACTICE PROBLEMS\*

SOURCES	"GROUP" ERROR SCORES on program recorded on FORM J.2(1)	TYPES OF PROGRAM PROBLEMS on which errors are made: identified on FORM J.2(1)	INTERVIEWS and/or OBSERVATIONAL DATA
CRITERIA	-The magnitude of the percentage of tryout students who made errors on program problems (or tasks) identifies which program problem is in need of revision  -The frequency of particular wrong answers or particular wrong procedures identifies the probable nature of the problem:  .Omissions  .Even distribution among wrong answers  .Uneven distribution among wrong answers	-Sub-criterion program problems and criterion program problems are identified on FORM J.2(1) -Error rates for individual items obtainable from "GROUP" scores (See column to the left) can be treated differently for:  •Problems or tasks which are part of a progression (leading up to a criterion behavior)  AND •Problems which involve criterion (or sub-criterion) behavior	-Interviews provide for student identification of difficulties with:  · Vocabulary, sentence complexity or length:  · Instructions or statement of objectives  · Attention or observation control techniques  · Content of problem  -Observation provides for identification of student difficulties with:  · Attention or observation control techniques  · Content of problem  · Content of problem  · Content of problem  · Content of problem  or task

\*Except for those program problems which involve sub-criterion or criterion behavior, test data usually provide no dependable information that can be easily traced back to individual program problems. See the next section for ways to treat situations in which errors occur (either on the program or on the test) on measures of sub-criterion or criterion behavior.

## IDENTIFYING NATURE OF WEAKNESS IN A PROGRAM PROBLEM OR TASK ON THE BASIS OF AVAILABLE DATA

MATRIX		<del></del>	
DATA AVAILABLE	Omission or answer or of procedure     Failure to attend or observe (as intended)     Student report of not understanding	••A particular wrong answer produced by many students ••Frequent attention to a wrong problem feature	••A <u>variety</u> of wrong answers produced by many students
ACTION TO TAKE	INTERPRET as evidence of one or more of the following:  -Vocabulary or language complexity inappropriate for target audience  -Absence of or incomplete:  •Task instructions  •Techniques to control attention/ observation  -Insufficient cuing to enable a correct response at that point in a progression	INTERPRET as evidence of one or more of the following:  -Task instructions or attention control techniques are: . Absent, incomplete . Misleading -Cuing provided for the problem may be: . Insufficient . Misleading	INTERPRET as  evidence of:  -Cuing provided for the problem may be insufficient at that point in the progression
EXAMPLES	e.g.,  -Vocabulary level or sentence length may be inappropriate for the age or grade of the students in the target audience	e.g.,  -Visual devices (arrows, charts) designed to control attention may be ambiguous or unclear causing student to attend to wrong information  -Clus provided with a problem may mislead students into producing a particular wrong answer	e.g., -Cuing may have been totally withdrawn in a problem too soon -Partial cuing provided li.e., indirect assistance) may be inadequate for the problem

## DETERMINING HOW TO REVISE INDIVIDUAL PROGRAM PROBLEMS OR TASKS TO OVERCOME IDENTIFIED WEAKNESSES

COND1TIONS	Problem FORMAT  ••Insufficient  or  ••Misleading	BEHAVIOR CONTROL TECHNIQUES  ••Insufficient  or  ••Misleading	CUING  ••Insufficient for the problem  ••Misleading
	Simplify or clarify  Vocabulary  Sentence structure  Task instructions	-Simplify or clarify  ··Attention or observation control techniques or devices	-If no cuing had been provided, consider the following possibilities:  ··Changing the example to an easier one (e.g., one already practiced) and leaving out cuing again  ··Adding indirect or partial cuing  -If indirect or partial cuing was used originally, make it stronger  -Do not resort to direct complete) cuing unless the problem is one occurring very surly in a progression

EXAMPLES	e.g., -Cut down sentence length -Use high frequency words in place of low frequency words -Use everyday language in place of literary language or technical language	e.g.,  -Make attention control devices larger, more prominent, easier to follow, etc.  -Provide for attention control when it is missing; e.g., "Look at the distance the load is from the fulcrum on this lever."	SEE OPPOSITE PAGE
	·		

## EXAMPLES ILLUSTRATING HOW WEAKNESSES OF INDIVIDUAL PROGRAM PROBLEMS OR TASKS CAN BE OVERCOME BY CHANGING CUING

### **EXAMPLES**

LEVELS OF CUING	ORIGINAL PROBLEM	MORE CUING	STILL MORE CUING
#1			
	The man has just applied a force to the cart.  In what direction must the cart be moving?	The man has jus∉ pushed the cart. In what direction must the cart be moving?	The man has just pushed the cart. The cart must be moving in the same direction.  In what direction must the cart be moving?
#2	Concentrate on making a correct loop (as you thread this film projector).	Concentrate on making a loop (as you thread this film projector). Hake swre the loop is neither too long nor too short.	Concentrate on making a loop (as you thread this film projector). Make sure the loop does not exceed these guide marks. (Guide marks provided)
#3			
	What class of lever is this?	What class of lever is this? A substitution of example makes this an easier problem.	Note that the resistance force is between the fulcrum and effort force. What class of lever is this?

## REVISING SEQUENTIAL SERIES OF PRACTICE PROFITMS

	page
Sources of information about weakness of a series of practice problems	190
Types of weaknesses in a series of practice problems	191-195
Revisions to make in a series of practice problems	196-201

## SOURCES OF INFORMATION ABOUT WEAKNESSES OF A SEQUENTIAL SERIES OF PRACTICE PROBLEMS

SOURCES  ERROR data on PROGRAM  From: FORM J.2(1)  An identification of a series of program problems on which a relatively high frequency of a series of errors has occurred.  An identification of a series of errors in which:  "Errors accur only on a maber of sub-aritarion problems leading up to them  "Errors occur on the preparatory progression problems leading up to them."  "Errors occur on the preparatory progression problems and the sub-aritarion or aritarion problems.  "An identification of including up to them."  "Errors occur on the preparatory progression problems and the sub-aritarion or aritarion problems.  "An identification (independent of error data on the preparatory progression problems."  "Errors occur on the preparatory progression problems and the sub-aritarion or aritarion problems. ## IDENTIFYING THE NATURE OF PROGRAM WEAKNESS BASED ONLY ON ERROR DATA ON PROGRAM PROBLEMS OR TASKS\*

INTERPRET Multiple omissions, or Multiple and varied wrong responses  ACTION as evidence of: An excessively lean progression: Insufficient cuing of responses to examples provided Insufficient number of program problems (offering different examples) A less than optimum sequence of problems examples	 		
**Multiple amissions, or **Multiple amissions,	 ••Preparatory problems  and on ••Sub-criterion problems	••Only on a series of sub-criterion problems (or criterion problems) ••But NOT on the preparatory progression problems	••A series of program problems which do not end in a sub-criterion behavior (there are additional problems
non-lear (i.e., too ruck assistance is provided)	<ul> <li>Multiple omissions, or</li> <li>Multiple and varied wrong responses</li> <li>as evidence of:         <ul> <li>An excessively lean progression:</li> <li>Insufficient cuing of responses to examples provided</li> <li>Insufficient number of program problems (offering different examples)</li> <li>A less than optimal sequence of problem</li> </ul> </li> </ul>	·Multiple omissions, or  ·Multiple and varied wrong responses, or  ·Multiple, systematic wrong responses as evidence of one or more of the following:  -Too rapid fading of cues before sub-criterion problems -Failure to provide the types of or umber of problems relevant to sub-criterion (or criterion) behavior  -Failure to provide practice with TRANSFER to sub-criterion facilitate TRANSFER to sub-criterion problems -A program sequence which is excessively MON-leam (i.e., too much assistance is	······································

## EXAMPLES

- e.g.,
- The amount or strength of cuing for the examples provided is insufficient for individual problems in the series or the fading of cuing is made too abruptly
- -The number of problems provided is too small to enable the student to be able to progress to the sub-criterion problem

#### e.g.,

- -The variety of examples used in the practice progression is too small or thin to enable the student to TRANSFER skills to new examples provided in sub-criterion problems
- -Too much assistance is provided and not faded out at all. laccounting for low errors on preparatory problems and high errors on subcriterion problems

#### e.g.,

-Pifficult examples occur in a sequence before easier ones li.e., examples which require more difficult transfer come earlie than ones which require less difficult transfer)

## IDENTIFYING THE NATURE OF WEAKNESS IN A SERIES OF PROGRAM PROBLEMS BASED ONLY ON "GROUP" TEST DATA (RELEVANT TO PROGRAM PROBLEMS ON WHICH ERRORS OCCURRED)

TEST RESULTS	GROUP error scores on tests:  ••Frequent omissions or  ••Frequent variable wrong answers	GROUP error scores on tests: ••Frequent systematic wrong answers	GROUP error scores on tests: ••Few errors on RECALL items ••Frequent errors on TRANSFER items
ACTION TO TAKE	INTERPRET as evidence of:  -An exce vively lean progression due to one or more of the following:  •Insufficiently strong cuing  •An insufficient number of examples or problems  •Premature or abrupt fading of cues	INTERPRET as evidence of:  -An excessively lean progression due to one or more of the following:  ·Insufficient variation in examples or problems  -Provision of misleading cues in program problems:  ·Use of atupical examples  ·Ambiguous statement of rules pertaining to problems	INTERPRET as evidence of:  -An excessively lean progression due to one or more of the following:  •Insufficient variation in examples or problems provided

IDENTIFYING THE NATURE OF WEAKNESS IN A SERIES OF PROGRAM PROBLEMS BASED ONLY ON "INDIVIDUAL" TEST DATA REVEALING DIAGNOSTIC PATTERNS (RELEVANT TO PROGRAM PROBLEMS ON WHICH ERRORS OCCURRED)

DIAGNOSTIC PATTERNS	Difficulties indicated for DISCRIMINATIONS	Difficulties indicated for GENERALIZATIONS	Difficulties indicated for ASSOCIATIONS
ACTION TO TAKE	INTERPRET as evidence of: -Program failure to do one or more of the following: ••Contrast INPUT	INTERPRET  as evidence of:  -Program failure to do  one or more of the  following:  ••Show similarities  between members of	INTERPRET  as evidence of:  -Program failure to do  one or more of the  following:  ··Identify the basis  for associating
	classes  ··Identify the basis for the difference between classes  ··Identify the boundaries between (limits) classes  ··Provide sufficient cuing to enable discriminations to be made  ··Provide enough examples of differing classes	each INPUT class  Identify the basis for the similarity between members of each class  Identify the limits of each class  Identify the limits of each class  Provide sufficient cling to enable generalizations to be made  Provide enough or varying examples within each class	INPUT class and a given ACTION  Provide sufficient cuing to enable associations to be formed  Provide sufficient practice problems or examples to enable associations to be formed

IDENTIFYING THE NATURE OF WEAKNESS IN A SERIES OF PROGRAM PROBLEMS BASED ONLY ON "DIAGNOSTIC" TEST DATA AND ON INTERVIEW/OBSERVATION (RELEVANT TO PROGRAM PROBLEMS ON WHICH ERRORS OCCURRED)

## DECISION MATRIX

DATA	DIAGNOSTIC tests identify difficulties with specific component skills:DiscriminationsGeneralizationsAssociations	INTERVIEW/OBSERVATION results:  ••Student questions  ••Student appearance of confusion  ••Student doing something other than what instructed to do
ACTION TO TAKE	INTERPRET as evidence of: -Program failure to deal with these skills (See page 193 for possible program failures which can account for each type of difficulty)	INTERPRET as evidence of:  -Program failure to do one or more of the following:  •Gear language difficulty to target audience  •Provide for adequate control of attention, observation  •Provide unambiguous instructions about tasks to be performed

## THREE MAJOR TYPES OF PROGRAM WEAKNESS WHICH HAVE TO BE ELIMINATED\*

TYPES OF PROGRAM WEAKNESS	(1) LEANNESS of program	(2) CONFUSIONS created by program	(3) SPECIFIC SKILLS not accommodated
CRITERIA	-Excessively lean:  ··Insufficient cuing in individual problems  ··Too abrupt fading of cues in series of problems  ··Insufficient number of program problems or examples  -Insufficiently lean:  ··Cuing maintained too long (not faded soon enough in series)  ··No uncued problems provided	-Vocabulary, sentence structure, etc., inappropriate for the target audience -Omission of or ambiguous statement of:ObjectivesTask instructionsDirections to control attention or observation -Examples used:AtypicalSequence of examples (difficult/ easy rather than other way around) -Cues used:Call attention to wrong INPUT or ACTION features	-Techniques appropriate to teaching of specific skills are:OmittedIncompletely implemented

\*All these types of weakness may coexist in varying combinations. Program revision will, therefore, have to deal with any or all of them which characterize a series of program problems.

SEE PAGES	196-197	198-199	200-201

## (1) DETERMINING HOW TO REVISE A SERIES OF PROGRAM PROBLEMS TO OVERCOME INAPPROPRIATE DEGREE OF LEANNESS

PROGRAM	EXCESSIVE	INSUFFICIENT
WEAKNESS	LEANNESS	LEANNESS
ACTION TO TAKE	-Deal with the series of problems before looking to individual problems:  ••Reduce the abruptness of fading:  /Maintain some type of cuing for more problems than before  /Increase the strength of cuing (where cuing is already provided)  ••Increase the number of problems  -Deal with individual problems making cuing strength appropriate to each problem and where it is in the series  (See pages 186-187)	

EXAMPLES	SEE OPPOSITE PAGE

#### EXAMPLES ILLUSTRATING REVISIONS WHICH OVERCOME PROGRAM WEAKNESS DUE TO "LEANNESS"\*

#### **EXAMPLES** ORIGINAL REVISION involves: a. #1 The addition of the following b. problems: **EXCESSIVE** When a sign instructs train passangers to pull LEANNESS -Before (a): the emergency cord, what is it instructing passangars To apply a downward force to it Describe the direction in In a sight-hand direction which the four forces are being applied to the box In which direction is Man A applying a force? and also the side of the In a night-hand direction box on which each one is being applied. From which side of the wagon are Man A and Man B applying the force? A is being applied from the <u>left of the box to the right</u> A from the left; B from B is being applied from What are some of the directions above in an upward direction c. in which a force can be applied C is being applied from the What do we mean by the to an object? right in a left-hand direction of a force? Give two contrasting examples Up, down, right, left direction different from the ones used here, D is being applied from Whether a push or a pull applied to the object is toward the right, left, When the sergeant tells recruits below in a downward to carry their own bags, what direction kind of force is he telling them to apply to the bags? A force applied in an upward direction. **REVISION involves:** OR IGINAL #2 a. INSUFFICIENT The addition of the following problems: LEANNESS -Following (c): What are some of the directions in which a force can be applied to an object? Up, down, right, left Write in the letter in the appropriate blank indicating the direction of the force. What do we mean by the direction c to the right p to the left of a force? Give two contrasting <u>A</u>downward 8 upward examples different from the ones used here. Whether a push or a pull applied to the object is toward the ь. c. right, left, up, or down The two forces The two forces shown are acting in shown are acting in which two which two directions? directions? A right-hand direction and In an upward and downward left-hand direction direction

Left-hand direction

<sup>\*</sup>Due to space limitations and for the purposes of illustrating a point, the examples provided below are artificially exaggerated; in #1 "excessive" is overexaggerated, and in #2 "insufficient" is overexaggerated.

#### (2) DETERMINING HOW TO REVISE A SERIES OF PROGRAM PROBLEMS TO OVERCOME CONFUSIONS CREATED BY THE SERIES OF PROBLEMS (On this and on opposite page)

PROGRAM WEAKNESS	Program poorly planned for target audience regarding:  ••Vocabulary (low frequency words)  ••Sentence length, structure	Omission of or ambiguous statement of:  ••Objectives  ••Task instructions  ••Directions to control attention or observation
ACTION TO TAKE	-Reduce difficulty level of vocabulary:  • Replace long words with short words  • Replace low frequency words with high frequency words (consult word frequency tables)  -Reduce difficulty level of sentences:  • Reduce the length of sentences  • Simplify the grammatical structure of sentences:  • Keep the number of sentences low  • Eliminate words or devices which are irrelevant to the task at hand	-Take care of "omissions" by providing necessary statements or techniques -Simplify, clarify, or strengthen all statements or techniques designed to quide:  • Task performance • Attention and observation behavior

#### **EXAMPLES**

In a right-hand direction

In which direction is Nam A applying a force? In a right-hand direction

from which side of the wagon are Man A and Man B applying the force? A from the left; B from the right side

#### e.g.,

ORIGINAL: Describe the direction in which the four forces (illustrated) are being applied to the box and also the side of the box on which each one is being applied.

REVISION:

Four forces are being applied to this box (illustrated). In which direction is each force being applied? To which side of the box is each force being applied?

REVISION: Add to the original:

Note the directions in which each arrow is pointing.

Also note on which side of the box each arrow

is placed.

## DECISION MATRIX

# (2) DETERMINING HOW TO REVISE A SERIES OF PROGRAM PROBLEMS TO OVERCOME CONFUSIONS CREATED BY THE SERIES OF PROBLEMS (On this and on opposite page)

	Examples used:	. Cues are:
PROGRAM WEAKNESS	••Atypical or low frequency ••In an ineffective sequence or order	Misleading (calling attention to wrong INPUTS or wrong properties of INPUTS)      Ambiguous, unclear
ACTION TO TAKE	-Replace examples less capable of eliciting responses with those more capable of doing so	-Simplify, clarify, or use new cues to:  ••Call attention to relevant
, TO TAKE	OR	properties of INPUT or ACTIO
	-Reorder the sequence of appearance of those examples:	··Call attention to what are n relevant properties of INPUT
	<ul> <li>Put concrete examples earlier in sequence before abstract ones</li> </ul>	or ACTIONS
	<ul> <li>Put visual examples before verbal examples</li> </ul>	

## EXAMPLES

(See example on page 198)

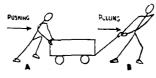

#### e.g.,

ORIGINAL: Describe the direction in which the four forces

(illustrated) are being applied to the box and also the

side of the box on which each one is being applied.

### REVISION

in which direction is Han 8 applying a force? In a right-hand direction

in which direction is Man A applying a force? In a right-hand direction

### REVISION: Add to original:

Note that an arrow representing a pulling force and one representing a pushing force are usually applied to different sides of a box.

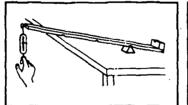

#### DECISION MATRIX

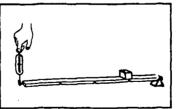

# (3) DETERMINING HOW TO REVISE A SERIES OF PROGRAM PROBLEMS TO OVERCOME THE FAILURE TO PROVIDE APPROPRIATE PRACTICE NEEDED FOR THE ACQUISITION OF SPECIFIC SKILLS (On this and on opposite pages)

MAIRIX		
PROGRAM WEAKNESS	DISCRIMINATIONS  ••Incompletely treated ••Inadequately treated	GENERALIZATIONS  ••Incompletely treated ••Inadequately treated
ACTION TO TAKE	-Do one or more of the following:  ··Contrast INPUT classes  ··Identify the basis for the difference between classes  ··Identify the boundaries (limits) between classes  ··Provide sufficient cuing to enable discriminations to be made  ··Provide enough examples of differing classes	-Do one or more of the following.  • Show similarities between members of each INPUT class  • Identify the basis for the similarity between members of each class  • Identify the limits of each class  • Provide sufficient cuing to enable generalizations to be made  • Provide enough or varying examples within each class

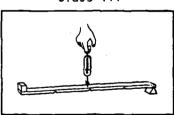

#### Class |

#### Class II

#### Class III

## EXAMPLES

"Note that the primary difference between the classes of levers consists of the position relative to one another of: (1) the load; (2) the effort force; and (3) the fulcrum"

"A diagram containing all three classes (as above) could be provided to give a contrasting overview of the three different classes."

"In all Class II levers, the load is between the effort force and the fulcrum. A wheelbarrow is another example of a Class II lever."

A diagram showing multiple examples can provide an overview of a single class.

DECISION MATRIX

(3) DETERMINING HOW TO REVISE A SERIES OF PROGRAM PROBLEMS
TO OVERCOME THE FAILURE TO PROVIDE APPROPRIATE PRACTICE NEEDED
FOR THE ACQUISITION OF SPECIFIC SKILLS
(On this and on opposite pages)

PROGRAM WEAKNESS	ASSOCIATIONS  ••Incompletely treated ••Inadequately treated	CHAINS*  ··Incompletely treated  ··Inadequately treated
ACTION TO TAKE	-Do one or more of the following:  ··Identify the basis for associating INPUT class and a given ACTION  ··Provide sufficient cuing to enable associations to be formed  ··Provide sufficient practice problems or examples to enable associations to be formed	-Do one or more of the following:  •Provide sufficient number of opportunities to practice the whole chain  •Provide cuing to assist the learner to remember the sequence in which parts of the chain are to be performed

\*Failure of students to produce a chain is not inferred; rather, it is directly observed by an observer as the student exhibits procedures or there is an absence of or an error in the 'work' (on paper and pencil).

#### **EXAMPLES**

Since the designation of a lever class (i.e., I, II, III) is arbitrary (i.e., a matter of convention) and not based on conceptual properties, additional practice in associating labels and examples should be provided.

In chaining verbal statements about definitions of lever classes (in addition to practice involving discriminations, generalizations, and chains) some practice in producing the whole chain should be provided (e.g., stating spatial relationships between load, fulcrum, and effort force).

## REVISING THE $\underline{\text{TOTAL}}$ INSTRUCTIONAL PROGRAM

page
204
205
206
207

The preceding section on revising a sequential series of program problems is applicable to the "revision of the total program." Accordingly, it will not be repeated.

To be added to the guidelines presented in the preceding section are some considerations about program weaknesses identified (1) by delayed testing, and (2) by the administration of program components in alternative sequences. The first of these follows on the next several pages. The second follows in the next section.

## SOURCES OF INFORMATION ABOUT WEAKNESSES OF A TOTAL PROGRAM

SOURCE	Ì	Difference in ERROR data on tests administered BEFORE and IMMEDIATELY AFTER instructional program	Difference in ERROR data on tests administered IMMEDIATELY AFTER the instructional program and on a DELAYED BASIS*
		From: FO	RM J.2(2)
CRITER	RIA	-GROUP error data on <u>all</u> test items related to each sub-criterion behavior and <u>all</u> test items related to the criterion behavior	
		From: FO	RM J.2(3)
		-INDIVIDUAL error patterns related to each sub-crite: all items related to the	rion behavior and
	I		
		obtained before and immediately after program administration serves to identify program weaknesses in allowing student acquisition of:	••The difference in error data obtained immediately after and on a delayed basis after program administration serves to identify program weaknesses in allowing student retention of:
		/Sub-criterion and criterion behaviors	/Sub-criterion and criterion behaviors
	ł	/Component skills	/Component skills

\*Delayed testing should be performed during the last tryout cycle when the instructional program is more likely to be capable of producing acceptable "acquisition" levels.

## IDENTIFYING THE NATURE OF PROGRAM WEAKNESS BASED ON RESULTS OF DELAYED TESTING

	<del></del>	· · · · · · · · · · · · · · · · · · ·
	On TOTAL test for:	On test items related to:
	··Sub-criterion behavior	••RECALL/TRANSFER
DATA	or ••Criterion behavior	or ••Specific skills
	-IMMEDIATE results show <u>low</u> error rates	-IMMEDIATE results show low error rates
	-DELAYED results show relatively high error rates	-DELAYED results show relatively high error rates
	INTERPRET as evidence of:	INTERPRET as evidence of:
ACTION TO TAKE	-Program failure to provide sufficient practice of the sub-criterion or of the criterion behavior	-Program failure to provide sufficient practice of the component skills
	-The orission may involve one or more of the following:	-The omission may involve one or more of the following:
	<ul> <li>Absence of sufficient repetition and/or review with old examples</li> </ul>	••Absence of sufficient repetition and/or review with old examples
	••Absence of repetition and/or review with new examples	··Absence of repetition and/or review with new examples
		ar:

## DETERMINING HOW TO REVISE A TOTAL PROGRAM EXCESSIVELY LEAN FOR "RETENTION" PURPOSES

PROGRAM WEAKNESS	Insufficient amount of practice of: ••Sub-criterion behavior ••Criterion behavior	Insufficient amount of practice of: ••Component skills ••TRANSFER problems
ACTION TO TAKE	Do one or more of the following:  ••Add more practice problems at the end of a progression relating to a sub-criterion (or to a criterion) behavior; include:  /Old examples  ord/or /New examples  ••Following practice with other sub-criterion behaviors, introduce review problems which can include:  /Old examples  and/or /New examples	Do one or more of the following:  Intersperse more practice problems relating to the skills not retained in the middle of the progression which is building up to a sub-criterion or criterion behavior:  /Preferably new examples  Insert the problems in that part of the series of problems devoted to a particular skill  If two or more component skills were taught separately, consider inserting items dealing with one skill at a time (particularly if retention failure is serious)

#### 1

## REVISING THE SEQUENCE OF PRACTICE\*

	page
Two types of sequencing issues	210
Sources of information about sequencing weaknesses	211
Revising the sequence of practice	212

\*Review pages 155-158.

### TWO TYPES OF SEQUENCING ISSUES

SEQUENCING ISSUES	Within a SINGLE program devoted to <u>one</u> criterion behavior	Between TWO or MORE programs devoted to two or more criterion behaviors
CRITERIA	-Have the separate sub-criterion behaviors, all of which relate to a single criterion behavior, been taught in the right sequence; i.e., has the sequence been so arranged that the learning of one sub-criterion behavior facilitated the learning of others; and, in turn, has the learning of the criterion behavior heen facilitated by the order in which its constituent sub-criterion behaviors have been learned	-Have programs devoted to two or more criterion behaviors been sequenced so that the learning of one has facilitated the learning of one or more of the others

EXAMPLES	The criterion behavior involves the relationship between balanced and unbalanced forces and movement of objects  Several sub-criterion behaviors have been identified:  Force  Strength of force  Objects in movement  Balanced/unbalanced force  The issue is: Is the order in which each of these sub-criterion behaviors has been learned the optimum one for facilitating the learning of them all?	-There are several criterion behaviors to be taught which involve these concepts:  •Force •Work •Machines  -The issue is: Is the order in which each of these criterion behaviors has been learned the optimum for facilitating the learning of them all?	
----------	---	---	--

## WHEN TWO DIFFERENT SOURCES ARE LIKELY TO BE USED

SOURCES OF INFORMATION	EXPERIMENTAL	STATISTICAL
ACTION TO TAKE	-Consider using the experimental approach in assessing sequencing adequacy only during INFORMAL tryout:  ••STEP J.1	-Consider using the statistical approach both during INFORMAL and DEVELOPMENTAL tryout:  ••STEP J.1  and ••STEP J.2

RATIONALE	-The experimental approach to assessing sequencing adequacy can provide more dependable results on which to base sequencing decisions	
	<pre>-It is, however, time-consuming and does dilute the size of the sample</pre>	
	-However, when time and student availability permit, it should be considered in both informal and developmental tryouts	

## DETERMINING HOW TO REVISE PROGRAM IN THE LIGHT OF SEQUENCING DEFICIENCIES\*

RESULTS	Experimental results identify:  -The administered sequence producing:  -Lowest average time to complete separate programs (or program section)  -Lowest average error rate on programs  -Lowest average error rate on tests	Statistical results identify: -Groups scoring high and low on one program:  ••Time to complete two or more programs  ••Errors on programs  ••Errors on tests -Comparison with these groups on another program reveal whether there is a facilitating effect
ACTION TO TAKE	-Alter the sequence of p the sequence favored by	ractice in keeping with results

\*Applicable to sequencing of sub-criterion behaviors related to a single criterion behavior or to sequencing of separate criterion behaviors.

## JOB PROCEDURES

SUMMARY OF PROCEDURES	228
Adequacy of the administration of the field test	229
·	
. :	

#1

- a. Select a sample of students which is representative of the target audience
- b. Whenever possible, select individual students on a random basis
- c. If necessary to use intact classes of students, select classes on a random basis (a minimum of about 15 classes)
- d. Insure that the sample includes a minimum of approximately 100 students. Sample sizes which are larger (up to approximately 300 students) will yield more reliable results

#2

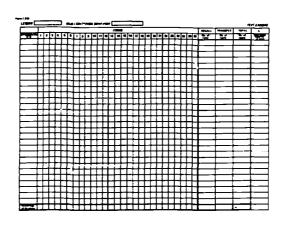

- a. Administer criterion and sub-criterion tests as "before" tests
- Administer instructional program
- c. Administer tests once again as an "after" test
- d. Score tests for errors

#3

a. Record test results on FORM J.2(2)

\*Field results are likely to involve programs for more than one criterion behavior. They are likely to include programs for an entire course.

FORM J.2(2)

#1

# From FORM J.2(2) summarizing test results for:

- ••Each sub-criterion behavior related to each criterion behavior
- ··Criterion behavior
- a. Compute for each student either:
  - ••The percentage of items answered correctly OR
  - ••The percentage of items answered incorrectly
- Correct the number of students attaining proficiency (or errors if preferred) in various score intervals:
  - ••90% or above
  - ··80%-39%
  - ..70%-79%
- c. Express the number of students attaining these levels as a percentage of the total sample
- d. Do this for "before" and "after" tests

#2

- a. Report the number of sub-criterion behaviors associated with each criterion behavior meeting various standards:
  - \*\*Percentage of sub-criterion behaviors for which (for example) 90% of students attain 90% of the test items
- b. Report other <u>lesser</u> standards met:
  - ••e.g., percentage of criterion behaviors for which 80% of students attain 80% of test items
- c. Present a frequency distribution of standards met for all criterion behaviors covered by an entire program

#3

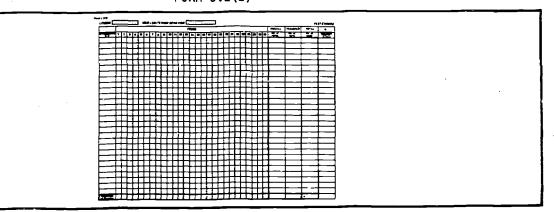

- a. Describe the sample of students used in the field test:
  - ..Size of sample
    used
  - ••Characteristics
     of sample:

/Age

/General ability levels

/Other information which is available and thought to be relevant to criterion behaviors to be learned

FORM J.2(2)

# J.3.3 STANDARDS MATRIX

## ADEQUACY OF REPORT OF FIELD TEST RESULTS

PROPERTIES	COMPLETENESS of report of RESULTS	COMPLETENESS of SAMPLE description
CRITERIA	-A report summarizing the percentage of students attaining various proficiency levels for:  • Each sub-criterion behavior related to a criterion behavior:  • Each of the criterion behaviors covered by a complete program  -A report summarizing the percentage of sub-criterion and criterion behaviors attained at varying levels of proficiency  -A report summarizing the difference between results obtained "before" and "after" program administration	•• Ace TO

	-Criterion Behavior #1 - 93% of sample scored 90% or better 05% of sample scored 90% or better Etc.	-Sample size: 200 -Grade Level: 3 -Age: Average = 8.2 -IQ: Average = 101
EXAMPLE	-Criterion Behavior #2 - 90% of sample scored 90% or better 08% of sample scored 80% or better Etc.	
	-Criterion Behavior #3 - Of the 32 criterion behaviors taught, 80% were taught at a 90%/90% level (See above), 15% were taught at a 80%/80% level, etc.
